THE DREAM & LIE OF LOUIS PASTEUR

“If I could live my life over again, I would devote it to proving that germs seek their natural habitat, diseased tissue—rather than being the cause of the diseased tissue.” –Rudolph Virchow

“Nothing is lost, nothing is created—all is transformed. Nothing is the prey of death. All is the prey of life.” –Antoine Béchamp

“The specific disease doctrine is the grand refuge of weak, uncultured, unstable minds, such as now rule in the medical profession. There are no specific diseases; there are specific disease conditions.” –Florence Nightingale

It is a rather serious matter to attack the reputation of a famous man, one who has posed and been accepted as one of the world's greatest scientists. For many years, Pasteur has been looked upon as a founder and leader in serology; but it is always pertinent to look into the beginnings of any subject on which there is a difference of opinion, with the hope of finding the truth in the matter.

The writer has made an effort in his prior books and pamphlets to show that the germ theory is false, and that illness was practically always due to errors of diet or manner of living, the germs being present solely as scavengers of dead and waste tissues and foods, and not as the cause of the disease.

However, the erroneous belief that germs cause disease and must be controlled or eliminated before it can be cured is so widespread as to close the minds of many people to any other ideas on this subject.

For this reason it seems that a thorough investigation of this idea, the grounds on which it is based, and even the bonafides of those who started it on its way, is necessary before any sane ideas as to the proper treatment of disease can be widely promulgated.

When Miss Ethel Douglas Hume brought out *Bechamp or Pasteur?* In 1923, it appeared to be just the thing that would fill this gap and end the use of serums and other biologicals forever. But it is now 19 years since that book, which should have marked an epoch in the healing arts, appeared. It did not receive the attention it deserved in medical circles and, though it is now in its second edition,* the medical profession are pushing biologicals harder than ever.

*Scientific Bluff

Hence it seems appropriate to go over the subject in order to show the truth regarding the falsity of Pasteur's ideas and claims to fame, and the fraudulent basis on which the germ theory rests, as was so well shown by Miss Hume in *Bechamp or Pasteur?* And to add other facts and statistics that support the idea that the germ theory is false, in the hopes that it may receive wider circulation and more general attention, and possibly lead to a complete overhauling of the question of the treatment of disease, especially regarding serology.

The translations from the French, and other material in chapters 2, 3, 4 and 5 not otherwise credited, are from *Bechamp or Pasteur?* by Ethel Douglas Hume. In closing, I wish to acknowledge my indebtedness to the Reverend and Mrs Wilber Atchison of Chicago for many suggestions and valuable assistance in the preparation of the manuscript. Miss L. Loat, secretary of the National Anti-Vaccination League of London, has also been very kind, responding to every request for information with more than could be used, some of it being especially compiled at the cost of considerable effort.

CHAPTER 1

PRIOR HISTORY OF THE "GERM THEORY"

If you back into the history of the medical profession and the various ideas regarding the cause of disease that were held by leading physicians before Pasteur first promulgated his notorious "germ theory", you will find convincing evidence that Pasteur discovered nothing, and that he deliberately appropriated, falsified and perverted another man's work.

The “germ theory”, so-called, long antedated Pasteur—so long, in fact, that he was able to present it as new; and he got away with it!

F. Harrison, Principal Professor of Bacteriology at Macdonald College (Faculty of Agriculture, McGill University), Quebec, Canada, wrote an Historical Review of Microbiology, published in Microbiology, a text book, in which he says in part:

"Geronimo Fracastorio (an Italian poet and physician, 1483-1553) of Verona, published a work (*De Contagionibus et Contagiosis Morbis, et eorum Curatione*) in Venice in 1546 which contained the first statement of the true nature of contagion, infection, or disease organisms, and of the modes of transmission of infectious disease. He divided diseases into those which infect by immediate contact, through intermediate agents, and at a distance through the air. Organisms which cause disease, called *seminaria contagionum*, he supposed to be of the nature of viscous or glutinous matter, similar to the colloidal states of substances described by modern physical chemists.

These particles, too small to be seen, were capable of reproduction in appropriate media, and became pathogenic through the action of animal heat. Thus Fracastorio, in the middle of the sixteenth century, gave us an outline of morbid processes in terms of microbiology."

For a book published more than three hundred years before Pasteur 'discovered' the germ theory, this seems to be a most astonishing anticipation of Pasteur's ideas, except that—not having a microscope—Fracastorio apparently did not realize that these substances might be individual living organisms.

According to Harrison, the first compound microscope was made by H. Jansen in 1590 in Holland, but it was not until about 1683 that anything was built of sufficient power to show up bacteria. He continues:

"In the year 1683, Antonius van Leenwenhoek, a Dutch naturalist and a maker of lenses, communicated to the English Royal Society the results of observations which he had made with a simple microscope of his own construction, magnifying from 100 to 150 times. He found in water saliva, dental tartar, etc., what he termed animalcula. He described what he saw, and in his drawings showed both rod-like and spiral form, both of which he said had motility. In all probability, the two species he saw were those now recognized as bacillus buccalis maximus and spirillum sputigenum.

Leenwenhoek's observations were purely objective and in striking contrast with the speculative views of M. A. Plenciz, a Viennese physician, who in 1762 published a germ theory of infectious diseases. Plenciz maintained that there was a special organism by which each infectious disease was produced, that microorganisms were capable of reproduction outside of the body, and that they might be conveyed from place to place by the air."

Here is Pasteur's great thought in toto—his complete germ theory—and put in print over a century before Pasteur thought of it, or published it as his own!

Note how concisely it anticipates all Pasteur's ideas on germs. While there seems to be no proof that Plenciz had a microscope, or knew of Leenwenhoek's animalcula, both are possible, and likely, as he was quite prominent; and he, rather than Pasteur, should have any credit that might come from such a discovery—if the germ theory has any value. This idea, which, to the people of that time at least, must have accounted easily and completely for such strange occurrences as contagion, infection and epidemics, would have been widely discussed in the medical or scientific circles of that time, and in literature available to Pasteur.

That it was widely known is indicated by the fact that the world famous English nurse, Florence Nightingale, published an attack on the idea in 1860, over 17 years before Pasteur adopted it and claimed it as his own.

She said of 'infection':

Diseases are not individuals arranged in classes, like cats and dogs, but conditions growing out of one another.

Is it not living in a continual mistake to look upon diseases as we do now, as separate entities, which must exist, like cats and dogs, instead of looking upon them as conditions, like a dirty and a clean condition, and just as much under our control; or rather as the reactions of kindly nature, against the conditions in which we have placed ourselves?

I was brought up to believe that smallpox, for instance, was a thing of which there was once a first specimen in the world, which went on propagating itself, in a perpetual chain of descent, just as there was a first dog, (or a first pair of dogs) and that smallpox would not begin itself, any more than a new dog would begin without there having been a parent dog.

Since then I have seen with my own eyes and smelled with my own nose smallpox growing up in first specimens, either in closed rooms or in overcrowded wards, where it could not by any possibility have been 'caught', but must have begun.

I have seen diseases begin, grow up, and pass into one another. Now, dogs do not pass into cats.

I have seen, for instance, with a little overcrowding, continued fever grow up; and with a little more, typhoid fever; and with a little more, typhus, and all in the same ward or hut.

Would it not be far better, truer, and more practical, if we looked upon disease in this light (for diseases, as all experience shows, are adjectives, not noun-substantives):

-True nursing ignores infection, except to prevent it. Cleanliness and fresh air from open windows, with unremitting attention to the patient, are the only defence a true nurse either asks or needs.

-Wise and humane management of the patient is the best safeguard against infection. The greater part of nursing consists of preserving cleanliness.

-The specific disease doctrine is the grand refuge of weak, uncultured, unstable minds, such as now rule in the medical profession. There are no specific diseases; there are specific disease conditions."

Here you have Florence Nightingale, one of the most famous nurses in history, after lifelong experience with infection, contagion and epidemics, challenging the germ theory 17 years before Pasteur put it forward as his own discovery! (See Ch.8, p.61).

She clearly understood it and its utter fallacy better before 1860 than Pasteur did, either in 1878 or later!

And, to see what a parasite Pasteur was on men who did things, let us digress and go back a few years, to the time when the study of germs was an outgrowth of the study of fermentation.

CHAPTER 2

BECHAMP, PASTEUR, AND FERMENTATION

About 1854, Professor Pierre Jacques Antoine Bechamp, one of France's greatest scientists, then Professor at the School of Pharmacy in the Faculty of Science at Strasbourg, later (1857-75) Professor of Medical Chemistry and Pharmacy at the University of Montpellier, a member of many scientific societies, and a Chevalier of the Legion of Honor, took up the study of fermentation.

He had succeeded in 1852 in so reducing the cost of producing aniline as to make it a commercial success, and his formula became the basis of the German dye industry. This brought him some fame, and many more problems to solve.

Up to this time, the idea prevailed that cane sugar, when dissolved in water, was spontaneously transformed at an ordinary temperature into invert sugar, which is a mixture of equal parts of glucose and fructose, but an experiment with starch had caused him to doubt the truth of this idea.

Therefore in May, 1854, Bechamp undertook a series of observations on this change, which came to be referred to as his "Beacon Experiment". In this experiment, he dissolved perfectly pure cane sugar in water in a glass bottle containing air, but tightly stoppered. Several other bottles contained the same solution, but with a chemical added.

In the solution without any added chemical, moulds appeared in about thirty days, and inversion of the sugar in this bottle then went on rapidly, but moulds and inversion did not occur in the other bottles containing added chemicals. He measured the inversion frequently with a polariscope.

These observations were concluded on February 3, 1855, and his paper was published in the Report of the French Academy of Science for the session of February 19, 1855.

This left the moulds without an explanation, so he started a second series of observations on June 25, 1856 (at Strasbourg) in order to determine if possible,

their origin, and on March 27, 1857, he started a third series of flasks to study the effects of creosote on the changes. Both series were ended at Montpelier on December 5, 1857.

In the second series he spilled a little liquid from flasks 1 and 2 during manipulation, so these two flasks contained a little air in contact with the liquid. In these two flasks, moulds soon appeared, and alteration in the medium ensued.

He also found that the changes were more rapid in the flask in which the mould grew more rapidly.

In the other nine flasks there was no air, no mould formed, and no inversion of the sugar occurred; plainly air was needed for the moulds and inversion to occur. This proved beyond any possibility of doubt that the moulds and inversion of the sugar could not be "spontaneous" action, but must be due to something carried in the air admitted to the first two flasks.

Yet Pasteur later called fermentation "life without air, or life without oxygen." At this time, it was quite generally believed that fermentation could not take place except in the presence of albuminoids, which were in general use by Pasteur and others as part of their solutions. Hence, their solutions could have contained these living organizations to start with.

Bechamp's solutions contained only pure cane sugar and water, and when heated with fresh-slaked lime did not disengage ammonia—ample proof that they contained no albumen. Yet moulds, obviously living organisms, and therefore containing albuminoid matter, had appeared in these two solutions.

Bechamp proved to his own satisfaction that these moulds were living organisms and that cane sugar was inverted, as he said "...only in proportion to the development of moulds. These elementary vegetations then acting as ferments."

Pasteur, apparently overlooking the air contact, challenged Bechamp's statements, saying:

"...to be logical, Bechamp should say that he has proved that moulds arise in pure sugared water, without nitrogen, phosphates or other mineral elements, for that is an enormity that can be deduced from his work, in which there is not the expression of the least astonishment that moulds have been able to grow in pure water with pure sugar without any other mineral or organic principles."

Bechamp's retort to this was:

"A chemist au courant with science ought not to be surprised that moulds are developed in sweetened water, contained in contact with air in glass flasks. It is the astonishment of Pasteur that is astonishing."

As Bechamp started with no nitrogen whatever except what was in the air in the first two flasks, it is probably the first time any growth or any kind of organism was proved to have absorbed nitrogen from the air. Apparently Pasteur could not grasp this idea!

In the preface to his last book, *The Third Element of the Blood*, Bechamp says that these facts impressed him in the same way that the swing of the cathedral lamp had impressed Galileo. He realized that some living organisms had been carried into these two flasks in the small amount of air admitted, and acting as ferments had produced the mould and the inversion in the sugar. He compared the transformation of cane sugar in the presence of moulds to that produced upon starch by diastase, the ferment that converts starch into sugar.

He sent in his report on these findings to the Academy of Science in December 1857, and an extract was published in its reports of January 4, 1858,⁵ though the full paper was not published until September that year.

He says of these experiments:

"By its title the memoir was a work of pure chemistry, which had at first no other object than to determine whether or not pure cold water could invert cane sugar and if, further, the salts had any influence on the inversion. But soon the question, as I had foreseen, became complicated; it became at once physiological and dependent upon the phenomena of fermentation and the question of spontaneous generation. Thus from the study of a simple chemical fact, I was led to investigate the causes of fermentation, and the nature and origin of ferments."

Although Schwann had suggested airborne germs in about 1837, he had not proved his ideas; here Bechamp proved them to exist.

Yet Pasteur in his 1857 memoirs still clings to the idea that both the moulds and ferments "take birth spontaneously", although his solutions all contained dead yeast or yeast broth which might have carried germs or ferments from the start.

He does conclude that the ferment is a living being, yet states that this "cannot be irrefutably demonstrated".

But Bechamp had demonstrated it "irrefutably" in his paper, and also had proved that water alone caused no alteration, there was no spontaneous alteration, and that moulds do not develop, nor inversion occur, without contact with the air; thus some airborne organism must cause the moulds and the inversion.

According to Miss Hume, Bechamp was also the first to distinguish between the "organized" or living ferment and the soluble ferment which he obtained by crushing the moulds, and which he found to act directly on the sugar, causing rapid inversion.

He named this substance zymase, in a paper *Memoirs on Fermentation by Organized Ferments*, which he read before the Academy of Science on April 4, 1864.

Strange to say, exactly the same word is used by others whom various encyclopaedias have credited with this discovery in 1897, over 30 years later!

In this paper he also gave his final complete explanation of the phenomena of fermentation, as being due to the nutrition of living organisms; i.e. a process of absorption, assimilation, and excretion.

In the preface to his last work (*The Third Element of the Blood*), Bechamp says (p.16):

"It resulted that the soluble ferment was allied to the insoluble by the relation of product to producer; the soluble ferment being unable to exist without the organized ferment, which is necessarily insoluble.

"Further, as the soluble ferment and the albuminoid matter, being nitrogenous, could only be formed by obtaining the nitrogen from the limited volume of air left in the flasks, it was at the same time demonstrated that the free nitrogen of the air could help directly in the synthesis of the nitrogenous substance of plants; which up to that time had been a disputed question.

"Thus it became evident that since the material forming the structure of moulds and yeast was elaborated within the organism, it must also be true that the soluble ferments and products of fermentation are also secreted there, as was the

case with the soluble ferment that inverted the cane sugar. Hence I became assured that that which is called fermentation is in reality the phenomena of nutrition, assimilation and dis-assimilation, and the excretion of the products dis-assimilated."

He explained further:

"In these solutions there existed no albuminoid substance; they were made with pure cane sugar, which heated with fresh-slaked lime, does not give off ammonia. It thus appears evident that airborne germs found the sugared solution a favourable medium for their development, and it must be admitted that the ferment is here produced by the generation of fungi.

The matter that develops in the sugared water sometimes presents itself in the form of little isolated bodies, and sometimes in the form of voluminous colourless membranes which come out in one mass from the flasks. These membranes, heated with caustic potash, give off ammonia in abundance."

This proved that albuminoids were present, hence the little bodies were living matter. It also proves that Professor Bechamp understood the formation and growth of moulds and ferments in 1857, years before Pasteur comprehended these physiological processes!

In 1859, over a year after Bechamp's paper covering his 1857 experiments was printed, Pasteur started another experiment more in line with Bechamp's ideas, in fact apparently inspired by them.

He omitted all yeast but used ammonia, which contains nitrogen, in his solutions, and then ascribed the origin of lactic yeast to the atmospheric air. He was surprised that animal and vegetable matter should appear and grow in such an environment. He says:

"As to the origin of the lactic yeast in these experiments, it is solely due to the atmospheric air; we fall back here upon facts of spontaneous generation."

After asserting that excluding atmospheric air or boiling the solution will prevent the formation of organisms, or fermentations, he says:

"On this point, the question of spontaneous generation has made progress."

In a still later memoir plainly inspired by Bechamp's Beacon Experiment, Pasteur again constantly refers to the spontaneous production of yeasts and fermentation.

There is no question but that he still believed in spontaneous generation of germs and ferments at this time, and his reasoning appears somewhat childish when compared to Bechamp's work.

However, in 1860, he started another experiment in which he prepared 73 phials of unfermented liquid to expose at various points on a much advertised-in-advance trip. He opened and resealed various phials at different places, the last twenty on the Mer de Glace above Chamonix.

He practically repeated Bechamp's experiments here, but of course he had to use a different and more spectacular method to get attention.

From this time he veered away from spontaneous generation, and began to explain the same occurrences (fermentation) as being caused by germs in the air.

Paul de Kruif in *Microbe Hunters* (a grandiose attempt to exalt some of the original experimenters in serumology), glosses over Pasteur's willingness to steal credit for the ideas of others, and after describing his use, without credit, of Ballard's suggestion of the swan neck bottle to admit dust free and germ free air into a flask, says of this "high Alps" experiment:

"Then Pasteur invented an experiment that was—so far as one can tell from a careful search through the records—really his own. It was a grand experiment, a semi-public experiment, an experiment that meant rushing across France in trains, it was a test in which he had to slither on glaciers." (p.83)

However, de Kruif doubted thoroughly that it was Pasteur's, and well he might! Yet little did he realize how few of Pasteur's foolhardy claims were either his own or, in fact, even true in any particular.

In a discussion of spontaneous generation at the Sorbonne during a meeting on November 22, 1861, Pasteur had the nerve to claim, in the presence of Professor Bechamp, all credit for the proof that living organisms appeared in a medium devoid of albuminoid matter! Bechamp asked him to admit knowledge of

Bechamp's 1857 work, but did not charge him with plagiarism, and Pasteur evaded the question, merely admitting that Bechamp's work was "rigidly exact". This was not an accident, but deliberate premeditated fraud; however, Bechamp was too much of a gentleman to make any unpleasant charges.

That it took several more years to get the spontaneous generation idea entirely out of Pasteur's head is indicated by the article on Pasteur in the 14th Edition of the Encyclopaedia Britannica, which says:

"The recognition of the fact that both lactic and alcohol fermentation were hastened by exposure to air naturally led Pasteur to wonder whether his invisible organisms were always present in the atmosphere or whether they were spontaneously generated. By a series of intricate experiments, including the filtration of air and the famous exposure of unfermented liquids to the pure air of the high Alps, he was able to declare with certainty in 1864 that the minute organisms causing fermentation were not spontaneously generated but came from similar organisms with which ordinary air was impregnated."

Here it is again—not until 1864 did he give up his idea of spontaneous generation—and the high Alps stuff was only high theatre, well advertised in advance, to enable him to grab Bechamp's discovery, and yet have some 'new stuff' to attract attention to himself. Of course, he could not follow exactly the same methods; some one might bring up Bechamp's memoirs, hence the "high Alps" and "slithering on glaciers".

His experiments made in 1859 also indicated knowledge of Bechamp's work without albuminoids, and his evasion of Bechamp's question at the Sorbonne meeting in 1861 lends further support to such a belief, while his attacks on Bechamp would indicate that he recognized a rival and was keenly jealous.

Note that this final acceptance of ideas that Bechamp had brought forward six years earlier did not come until after Bechamp had published his complete paper, with a full and most thoroughly proven explanation of the processes of fermentation.

However, Pasteur had, on completion of his "high Alps" experiment in 1860, accepted, or began to accept, the idea that germs of the air caused fermentation; and soon he leaped way ahead to the conclusion that these germs also caused disease, as Plenciz had suggested about a hundred years before!

Of this idea, he had no more proof than Plenciz, except that it was now known there were germs in existence, which Plenciz, apparently, did not prove.

Although Bechamp had made clear the physiological nature of fermentation in his paper on his 1857 experiments (published in 1858), and had given more complete details in his 1864 paper, Pasteur apparently had not fully grasped its true nature as late as 1872, when he published a paper in which he stated:

"That which separates the chemical phenomenon of fermentation from a crowd of other acts and especially from the acts of ordinary life is the fact of the decomposition of a weight of fermentative matter much superior to the weight of the ferment."

Could anyone make such a statement who really understood the true nature of fermentative action? Apparently Pasteur did not!

In collaboration with A. Estor, Bechamp answered this with an effort to make the nature of fermentation clear, in a paper printed on page 1523 of the same volume, in which he said:

"Suppose an adult man to have lived a century, and to weigh on average 60 kilograms. He will have consumed in that time, besides other foods, the equivalent of 20,000 kilograms of flesh, and produced about 800 kilograms of urea. Of course there is no suggestion that this mass of flesh and urea could at any moment of his life form part of his being.

Just as a man consumes all that food only by repeating the same act a great many times, the yeast cell consumes the great mass of sugar only by constantly assimilating and dis-assimilating it, bit by bit. Now, that which only one man will consume in a century, a sufficient number of men would absorb in a day.

It is the same with the yeast; the sugar that a small number of cells would only consume in a year, a greater number would destroy in a day. In both cases, the more numerous the individuals, the more rapid the consumption."

Is that not clear enough, even for a man whose diploma was marked "mediocre in Chemistry" (Pasteur) to comprehend? It seems that a child should be able to understand it.

Yet Pasteur repeated his statement four years later in *Etudes sur la Bier* (1876), so Bechamp's clear explanation apparently failed to have any effect—at least on him.

Here is proof that from eight to fourteen years after Bechamp had completely disclosed the physiological nature of fermentation and described its action minutely, Pasteur had not yet grasped the facts regarding the process!

In its article on fermentation, the *Encyclopaedia Britannica* says:

“Fermentation, according to Pasteur, was caused by the growth and multiplication of unicellular organisms out of contact with free oxygen, under which circumstances they acquire the power of taking oxygen from chemical compounds in the medium in which they are growing. In other words, 'fermentation is life without air, or life without oxygen'. This theory of fermentation was materially modified in 1892 and 1894 by A. J. Brown, who described experiments which were in disagreement with Pasteur's dictum.”

So did Bechamp over 35 years earlier—in 1855 and 1858—and Pasteur appropriated and perverted his ideas.

Pasteur also jumped to the conclusion that each kind of fermentation had one specific germ, while Bechamp proved that each microorganism might vary its fermentative effect in conformity with the medium in which it finds itself. He also showed that these microorganisms, under varying conditions, might even change their shape, as has been recently proved so conclusively by F. Loehnis and N. R. Smith of the U.S. Dept. of Agriculture and others.

Pasteur, however, proceeded to classify his germs and label each with a definite and unalterable function, wherein he was wrong again, as we shall see later.

CHAPTER 3

VINOUS FERMENTATION

Another step that went along with the work on fermentation in general was the discovery of the causes of diseases in French grapes.

Bechamp, hearing of the commotion over this trouble in the vineyards, quietly took up a study of it in 1862, the year before Pasteur turned his attention to the subject.

Bechamp exposed to contact with air:

- 1) grape-must as found on the vines,
- 2) grape-must filtered, and
- 3) grape-must de-colored by animal charcoal.

They all fermented, but not equally so, and the moulds or ferments developed were not identical in these three experiments, which of course caused him to seek a reason for this.

On further experiments, with the rigid exclusion of all air (the whole healthy grapes, with stalks attached, being introduced directly from the vine into boiled sweetened water, cooled with carbonic acid gas bubbling through it), fermentation took place, and was completed in this medium, proving that air was not required. Hence the ferment must have been carried on the grapes, and was not airborne.

Professor Bechamp concluded that the organism causing the must to ferment must be carried on the grape, its leaves, or the vines, and that it might also be an organism injurious to the plants.

He published a volume on vinous fermentation in 1863, entitled *Lecons sur la Fermentation Vineuse et sur la Fabrication du Vin*, in which he gave an intelligent discussion of the subject.

He also presented two papers on the making of wine to the Academy, entitled *Sur les Acids du Vin* and *Sur l'utilite et les Inconvienient du Cuvages Prolonges dans la Fabrication du Vin-Sur la Fermentation Alcoolique dans cette Fabrication*. In October 1864 he presented a communication to the Academy of Science on *The Origin of Vinous Fermentation*, an exhaustive account of the experiments described above.

This paper was a complete study of the subject, in which he proved that vinous fermentation was due to organisms found on the skins of grapes and also often found on the leaves and other parts of the vine. Hence at times, diseased vines might affect the quality of the fermentation and the resulting wine.

Thus by October 1864, Bechamp had several authoritative papers in print, but where was his super learned rival?

In 1862 Pasteur was admitted to the French Academy through the influence of Biot and the Mineralogical Section, which based its nomination and support on Pasteur's past work on crystallography; yet many attacks were made on his treatment of that subject, and he took the advice of friends to drop this line of work!

In March 1863, he met the Emperor and was soon sent to the vineyards to study the grape disease, with the prestige of having the Emperor's backing.

He published several papers on the vines and their troubles in the latter part of 1863 and in 1864, but apparently was still riding his spontaneous generation theory which Bechamp had so completely exploded in 1858, and he did not guess correctly as to the cause of the trouble with the vines.

In 1865 he offered five papers, and others came later, but he does not seem to have hit on the right answer to the problem until 1872, when he made the great discovery that Bechamp was right again! In this year, Pasteur presented a memoir entitled *New Experiments to Demonstrate that the Yeast Germ that Makes Wine comes from the Exterior of Grapes*.

As Bechamp had made the same statement in his 1864 paper and it had not been disproven in the intervening eight years, it was a pretty safe bet for Pasteur to make!

CHAPTER 4

BECHAMP'S MICROZYMAS OR "LITTLE BODIES"

As shown in the second chapter, Bechamp was the first to prove that the moulds accompanying fermentation were, or contained, living organisms, and could not be spontaneously generated but must be an outgrowth of some living organism carried in the air.

This much was in his 1858 memoir, six years before Pasteur came to the same conclusions.

Being first to realize that these moulds or ferments were living organisms, he naturally was also the first to attempt to determine their true nature and functions, and their origins.

On putting some under the microscope, he noted a diversity in appearance of the moulds and was soon involved in a study of cell life.

In his earlier experiments, Bechamp had used several salts, including potassium carbonate, in the presence of which the inversion of cane sugar did not take place. But when he repeated this experiment using calcium carbonate (common chalk) instead of the potassium carbonate, he found that inversion of the cane sugar did take place, even when creosote was added. This observation was so unexpected that he omitted it from his earlier memoir in order to verify it before publication of the fact.

In carefully controlled experiments he found that when chemically pure calcium carbonate, CaCO_3 , was added to his sugar solutions, no inversion took place, but when ordinary chalk, even that chipped from the native rock without access of air, was used, inversion always occurred.

On heating the common chalk to 300 degrees, he found that it lost its powers of fermentation, and on examining more of the unheated common chalk under the microscope, he found it contained some "little bodies" similar to those found in

prior observations, and which he found did not exist in the chemically pure CaCO_3 , nor in the chalk that had been heated.

These "little bodies" had the power of movement and were smaller than any of the microphytes seen in fermentation or moulds, but were more powerful ferments than any he had encountered previously.

Their power of movement and production of fermentation caused him to regard them as living organisms.

He advised Dumas of his discovery of living organisms in chalk in December 1864, and later, on September 26, 1865, he wrote a letter which Dumas had published. He stated:

"Chalk and milk contain already developed living beings, which is proved by the fact that creosote, employed in a non-coagulating dose, does not prevent milk from finally turning, nor chalk, without extraneous help, from converting both sugar and starch into alcohol and then into acetic acid, tartaric acid, and butyric acid".

Which of course was ample proof that there was a ferment, a living organism, present in both milk and chalk.

He said of these:

"The naturalist will not be able to distinguish them by a description; but the chemist and also the physiologist will characterize them by their function.

Professor Bechamp found that the chalk seemed to be formed mostly of the mineral or fossil remains of a "microscopic world" and contained organisms of infinitesimal size, which he believed to be alive.

He also believed they might be of immense antiquity, as he had traced the block of limestone he had used to the Tertiary Period in geology; yet he found that stone cut from the solid ledge, with all air excluded, had "wonderful" fermentative powers, which he traced to the same "little bodies" as he had found to cause fermentation in his earlier experiments. He concluded that they must have lived embedded in the stone of the ledge for many thousands of years.

In 1866 he sent to the Academy of Science a memoir called On the role of chalk in butyric and lactic fermentations, and the living organism contained in it.

In this paper, he named his "little bodies" microzymas, from the Greek words meaning small ferment.

He also studied the relations of his microzymas of chalk to the molecular granulations of animal and vegetable cells, with many more geological examinations, and wrote a paper entitled On Geological Microzymas of Various Origins, which was abstracted in Comptes Rendus of the session of April 25, 1870.

He proved that the molecular granulation found in yeast and other animal and vegetable cells had individuality and life and also had the power to cause fermentation, and so he called them microzymas also.

He called his geological microzymas "morphologically identical" with the microzymas of living beings.

In innumerable laboratory experiments, assisted now by Professor A. Estor, another very able scientist, he found microzymas everywhere, in all organic matter, in both healthy tissues and in diseased, where he also found them associated with various kinds of bacteria.

After painstaking study they decided that the microzymas rather than the cell were the elementary units of life, and were in fact the builders of cell tissues. They also concluded that bacteria are an outgrowth or an evolutionary form of microzymas that occur when a quantity of diseased tissues must be broken up into its constituent elements.

In other words, all living organisms, he believed, from the one celled amoeba to mankind, were associations of these minute living entities, and their presence was necessary for cell life to grow and for cells to be repaired.

Bacteria, they proved, can develop from microzyma by passing through certain intermediate stages, which they described, and which have been regarded by other researchers as different species!

The germs of the air, they decided, were merely microzymas, or bacteria set free

when their former habitat was broken up, and they concluded that the "little bodies" in the limestone and chalk were the survivors of living beings of long past ages.

This brought them to the beginning of 1868, and to test these ideas they obtained the body of a kitten²⁵ which they buried in pure carbonate of lime, specially prepared and creosoted to exclude any airborne or outside germs.

They placed it in a glass jar and covered the open top with several sheets of paper, placed so as to allow renewal of the air without allowing dust or organisms to enter. This was left on a shelf in Bechamp's laboratory until the end of 1874.

When opened, it was found that the kitten's body had been entirely consumed except for some small fragments of bone and dry matter. There was no smell, and the carbonate of lime was not discoloured.

Under the microscope, microzymas were not seen in the upper part of the carbonate of lime, but "swarmed by thousands" in the part that had been below the kitten's body.

As Bechamp thought that there might have been airborne germs in the kitten's fur, lungs or intestines, he repeated this experiment, using the whole carcass of a kitten in one case, the liver only in another, and the heart, lungs and kidneys in a third test. These viscera were plunged into carbolic acid the moment they had been detached from the slaughtered animal. This experiment began in June 1875 and continued to August 1882—over seven years.

It completely satisfied him that his idea that microzymas were the living remains of plant and animal life of which, in either a recent or distant past, they had been the constructive cellular elements, and that they were in fact the primary anatomical elements of all living beings, was correct.

He proved that on the death of an organ its cells disappear, but the microzymas remain, imperishable!

As the geologists estimated that the chalk rocks or ledges from which he took his "geological microzymas" were 11 million years old, it was proof positive that these microzymas could live in a dormant state for practically unlimited lengths of time.

When he again found bacteria in the remains of the second experiment, as he had in the first, he concluded that he had proved, because of the care taken to exclude airborne organisms, that bacteria can and do develop from microzymas, and are in fact a scavenging form of the microzymas, developed when death, decay, or disease cause an extraordinary amount of cell life either to need repair or be broken up.

He wrote in 1869:

In typhoid fever, gangrene and anthrax, the existence has been found of bacteria in the tissues and blood, and one was very much disposed to take them for granted as cases of ordinary parasitism. It is evident, after what we have said, that instead of maintaining that the affection has had as its origin and cause the introduction into the organism of foreign germs with their consequent action, one should affirm that one only has to deal with an alteration of the function of microzymas, an alteration indicated by the change that has taken place in their form."

This view coincides well with the modern view of all germs found in nature, except those in the body, which are still looked on as causing the conditions they are found with, rather than being the result of these conditions, which is their true relation to them.

The Encyclopedia Britannica says in the entry on bacteriology:

"The common idea of bacteria in the minds of most people is that of a hidden and sinister scourge lying in wait for mankind. This popular conception is born of the fact that attention was first focused upon bacteria through the discovery, some 70 years ago, of the relationship of bacteria to disease in man, and that in its infancy the study of bacteriology was a branch of medical science. Relatively few people assign to bacteria the important position in the world of living things that they rightly occupy, for it is only a few of the bacteria known today that have developed in such a way that they can live in the human body, and for every one of this kind, there are scores of others which are perfectly harmless and far from being regarded as the enemies of mankind, must be numbered among his best friends.

"It is in fact no exaggeration to say that upon the activities of bacteria the very existence of man depends; indeed, without bacteria there could be no other

living thing in the world; for every animal and plant owes its existence to the fertility of the soil and this in turn depends upon the activity of the microorganisms which inhabit the soil in almost inconceivable numbers. It is one of the main objects of this article to show how true is this statement; there will be found in it only passing reference to the organisms which produces disease in man and animals; for information on these see Pathology and Immunity."

The writer of the above thoroughly understands germs or bacteria with only one exception; the bacteria found in man and animals do not cause disease. They have the same function as those found in the soil, or in sewage, or elsewhere in nature; they are there to rebuild dead or diseased tissues, or rework body wastes, and it is well known that they will not or cannot attack healthy tissues. They are as important and necessary to human life as those found elsewhere in nature, and are in reality just as harmless if we live correctly, as Bechamp so clearly showed.

CHAPTER 5

SILK WORM DISEASE: ANOTHER STEAL!

Between 1855 and 1865 a widespread epidemic among silk worms called pebrine alarmed the south of France, so much so that finally, in 1865, it drew national attention.

Professor Bechamp, early in 1865, took up the study of this epidemic entirely at his own expense, and without the aid of others, and quickly found it was caused by a small parasite.

His long experience with small microorganisms, and the way creosote had inhibited their growth in his Beacon Experiment of 1854 and 1855, at once suggested the way out.

Hence he was able to state before the Agricultural Society of Herault the same year that pebrine was a parasitic disease and that thin creosote vapour would prevent the attack of the parasite.

However, in the meantime, the Government had taken an interest in the subject, and in June 1865 sent Pasteur down to investigate the disease.

Pasteur, with the prestige of being an official representative of the government, was able to centre all attention on his own work, to the depreciation of the work of others, though he admitted having never touched a silk worm before he started on this mission.

Nevertheless, the fact that something 'official' was being done caused agricultural societies to await his verdict, instead of at once taking up Professor Bechamp's ideas.

Pasteur's first statement on his new subject was made in September 1865, when he published a very erroneous description, claiming:

"The corpuscles are neither animal nor vegetable, but bodies more or less analogous to cancerous cells or those of pulmonary tuberculosis. From the point of view of a methodic classification, they should rather be ranged beside globules of pus, or globules of blood, or better still, granules of starch, than

beside infusoria or moulds...It is the chrysalide rather than the worm, that one should try to submit to proper remedies."

This description shows that he had no conception of the real nature of the problem.

Bechamp's comment was:

"Thus this chemist, who is occupying himself with fermentation, has not begun to decide whether or not he is dealing with a ferment."

Pasteur, about this time, dropped his work because of the deaths of his father and two of his daughters, and before going back, spent a week at the Palace of Compiègne as the guest of Napoleon III.

In February 1866, he again took up the poor silk worms' troubles and had the assistance this time of several able French scientists, yet they made very little progress on the problem.

Meanwhile, Bechamp had made further studies on pebrine, and sent a paper entitled *On the Harmlessness of the Vapors of Creosote in the Rearing of Silk Worms* to the Academy of Science.

In this article he repeated the statements he had made before the Agricultural Society at Herault and added that:

"The disease is parasitical. Pebrine attacks the worms at the start from the outside and the germ of the parasite comes from the air. The disease, in a word, is not primarily constitutional."

He described developing the eggs or seeds of the silk worm in an enclosure permeated with a slight odour of creosote, in which he produced eggs entirely free of pebrine, and it took so little creosote that his methods were commercially practical.

However, Pasteur had not yet found the true cause of the trouble. He sent a paper entitled *New Studies on the Disease of Silk Worms* to the Academy, in which he said:

"I am very much inclined to believe that there is no actual disease of silk worms.

I cannot better make clear my opinion of silk worm disease than by comparing it to the effects of pulmonary phthisis. My observations of this year have fortified me in the opinion that these little organisms are neither animalcules nor cryptogamic plants. It appears to me that it is chiefly the cellular tissue of all the organs that is transformed into corpuscles or produces them."

But again he guessed wrong, and neither he nor all of his assistants could prove statements that were false.

He also took a slap at Bechamp's paper by saying:

"One would be tempted to believe, especially from the resemblance of the corpuscles to the spores of mucorina, that a parasite had invaded the nurseries. That would be an error."

And yet Bechamp had already proved beyond question that it was nothing else but a parasite! Possibly, jealousy caused Pasteur to take a contrary view.

Pasteur, apparently, had not finally given up his "spontaneous generation" ideas until 1862 or 1864, and since then, had ascribed all signs of fermentation, and all disease, to airborne germs, yet here he denies that this disease is parasitic! And after Bechamp's papers proved it!

Bechamp answered him in a paper entitled *Researches of the Nature of the Actual Disease of Silk Worms* which contained more proofs of its parasitical nature.

He said that the vibrant corpuscle:

"...is not a pathological production, something analogous to a globule of pus or a cancer cell, or to pulmonary tubercles, but is distinctly a cell of a vegetable nature."

In another paper Bechamp described experiments that proved the corpuscle to be an organized ferment that would invert sugar, and produce alcohol, acetic acid, etc.

This paper seemed to convince Pasteur that Bechamp was right, for in January 1867, in a letter written to Durny, Minister of Public Instruction, he began to claim all credit for Bechamp's ideas on the silk worm diseases.

Bechamp provided a still more complete account of his discovery which the Academy printed on April 29, 1867, and the same issue contained a letter from Pasteur to Dumas, dated April 24, in which he expressed regrets over his "mistakes" and promised a paper with a complete story of the disease soon.

On May 13, 1867, Bechamp sent a letter to the President of the Academy of Science pointing out Pasteur's errors and asking recognition of the priority of his own discoveries regarding silk worm diseases. He also sent another paper entitled *New Facts to Help the History of the Actual Disease of Silk Worms and the Nature of the Vibrant Corpuscles*.

In this paper he described the corpuscles as airborne and to be found on mulberry leaves, and he also described a second silk worm disease different from pebrine, which he called flacherie, and on which he had published a pamphlet privately, on April 11, 1867.

In the meantime he had also submitted several papers on various microscopic organisms, more or less broadening the general knowledge on this subject; one of which was a general study of bacterial development from his microzymas.

In a paper entitled *On the Microzymian Disease of Silk Worms* Bechamp gave a full description of this second disease called flacherie. This was published in the paper dated June 8, 1868, and on June 24 Pasteur wrote to Dumas claiming to have been the first to discover this second silk worm disease and demanding that a note he claimed to have sent to the Agricultural Society of Alais on June 1 be printed (as the records then contained no proof of Pasteur's claim to this).

Bechamp answered this claim in a note entitled *On the Microzymian Disease of Silk Worms, in Regard to a Recent Communication of M. Pasteur*, which was published under the date of July 13, 1867, in which he referred to his pamphlet of April 11, 1867, (revised and reprinted March 28, 1868) and his papers of May 13 and June 10, 1867, all of which were prior to any publication of Pasteur's!

However, Pasteur used his prestige as a Government representative to browbeat others into coming to his support, and he was finally widely recognized, and Bechamp's claims as to the discoveries on silk worm diseases ignored. The majority of those who knew his claims were false were afraid to oppose anyone who was so close to Napoleon, and who had so much official standing as Pasteur

then had.

In his book on the diseases of silk worms, Pasteur takes all the credit for these discoveries, and shows how ignorant of the subject he still is by ridiculing Bechamp's statements that creosote was a preventative—so he knew of them!

Miss Hume says that members of the Academy actually asked Professor Bechamp to drop his use of the word microzyma, and even to drop his work!

In *Microbe Hunters*, Paul de Kruif gives a slightly different version of Pasteur's work on silk worms from that outlined above. He states that Dumas, his old professor, appealed to Pasteur to help the silk worm growers of southern France, and continues:

"Anything but a respecter of persons, Pasteur, who loved and respected himself above all men, had always kept a touching reverence for Dumas. He must help his sad old professor! But how? It is doubtful at this time that Pasteur could have told a silk worm from an angle worm! Indeed, when he was first given a cocoon to examine, he held it up to his ear, shook it and cried: 'Why there is something inside it!'" (p.91.)

De Kruif also ascribes the belated discovery that pebrine was a parasitical disease to Gernez, one of his assistants, and says:

"Gernez hurried to Pasteur. 'It is solved,' he cried, 'the little globules are alive—they are parasites! They are what makes the worms sick!'

It was six months before Pasteur was convinced that Gernez was right, but when at last he understood, he swooped back to his work, and once more called the committee together.

"The little corpuscles are not only a sign of the disease, they are its cause. These globules are alive, they multiply, they force themselves into every part of the moth's body." (p.95.)

It is strange that with the dispute raging between Bechamp and Pasteur over who had discovered that pebrine was a parasitical disease, Gernez did not speak of his own claims in the matter—possibly a job was more important.

De Kruif continues:

"He was 45. He wallowed in this glory for a moment and then—having saved the silk worm industry with the help of God and Gernez—he raised his eyes toward one of those bright, impossible, but always partly true visions that it was his poet's gift to see. He raised his artist's eyes from the sickness of silk worms to the sorrows of mankind:

'It is in the power of man to make parasitic maladies disappear from the face of the globe, if the doctrine of spontaneous generation is wrong as I am sure it is!'" (p.97.)

His 45th year must have been 1867, and Bechamp had proven spontaneous generation wrong in 1855 or '56, as described earlier, at least 10 years beforehand. Clearly de Kruif did not look far enough; the name of Bechamp, the greatest of all, and the only 'microbe hunter' who really understood their true place in nature, does not appear in his book Microbe Hunters at all!

In spite of all his errors in the work on silk worms, and because of his high position and royal favouritism, Pasteur was put in charge of the practical measures of fighting this parasite, and of course did not adopt Bechamp's method of using creosote vapour.

Dr A. Lateud, at one time editor of the Journal de Medecine de Paris, charged that whereas in 1850 France had produced 30 million kilograms of cocoons, and its output had sunk to 15 million kilograms in 1866-7 due to the epidemic, after Pasteur's methods of 'prevention' had been introduced, production shrank to 8 million kilograms in 1873 and as low as 2 million kilograms in certain subsequent years. He continued:

"That is the way in which Pasteur saved sericulture! The reputation which he still preserves in this respect among ignoramuses and shortsighted savants has been brought into being:

—by himself, by means of inaccurate assertions;

—by the sellers of microscopic seeds on the Pasteur system, who have realized big benefits at the expense of the cultivators;

—by the complicity of the Academies and public bodies, which, without any investigation, reply to the complaints of the cultivators:

“But sericulture is saved! Make use of Pasteur's system!' However, everybody is not disposed to employ a system that consists in enriching oneself by the ruination of others.”

Plainly his sins found him out here—at least with those who were in closest touch with the silk worm cultivators!

It is astonishing, in view of such a failure—and after Bechamp had shown how to prevent these diseases—that Pasteur's reputation did not go down in a public scandal!

Apparently royal favour and the academies and public bodies protected him from this.

CHAPTER 6

PASTEUR ALSO A FAKER: ANTISEPSIS

While many of Pasteur's contemporaries must have known of his plagiarisms from Bechamp's work, they were probably cowed into silence, or kept out of the press by Pasteur's bully ragging tactics, as well as by his prestige, not only in the public eye and with royalty, but also with the "academies and public bodies" Dr Lateud refers to.

Miss Hume goes on to show that his treatment for rabies and his anthrax serum were the same colossal failure and fraud, as will be shown in Chapter Eight, and she discusses other plagiarisms on Pasteur's part, but it hardly seems necessary to go into all of these matters here. We have seen enough evidence of incompetence and fraud to forever doubt any further statements that bear his signature, but there is one more piece of work that is worth looking into.

Some years after the events we have described, Dr M. L. Levenson, M.D., Ph.D., M.A., an American physician, discovered some of Professor Bechamp's writings in New York and immediately realized that they anticipated Pasteur in certain important points. He went to France, met Professor Bechamp, and heard the story of the plagiarism from him, since which time he has done a great deal to bring Bechamp's work to public attention.

He was one of the first in the United States to recognize Bechamp's priority in regard to most of the discoveries generally credited to Pasteur, and in a lecture entitled Pasteur, the Plagiarist, delivered at Claridges Hotel, London, on May 25, 1911, outlined briefly Bechamp's claim to priority, and added the charge that Pasteur had deliberately faked an important paper!

He said in part:

"Pasteur's plagiarisms of the discoveries of Bechamp, and of Bechamp's collaborators, run through the whole of Pasteur's life and work, except as to crystallography, which may or may not have been his own. I have not investigated that part of his career, nor do I feel any interest in it. The tracings of some of these plagiarisms, though they can be clearly demonstrated, are yet

somewhat intricate, too much so for this paper; but there is one involving the claim by Pasteur to have discovered the cause of one of the diseased conditions which assail the silk worm, which can be verified by any one able to read the French language. It is the following:"

After describing some of the material we have covered in Chapter 5, he continues:

"But I have a still graver and more startling charge to bring against Pasteur as a supposed man of science.

Finding how readily the 'men of science' of his day accepted his fairy tales, in a voluminous memoir of no value (published in the *Annales de Chimie et de Physique* 3rd S., Vol. LVIII), is to be found on page 381 a section entitled Production of Yeast in a Medium Formed of Sugar, of a Salt of Ammonia and of Phosphates.

The real, though not confessed, object of the paper was to cause it to be believed that he, and not Bechamp, was the first to produce a ferment in a fermentative medium without albuminoid matter. Now mark, I pray you, what I say—the alleged experiment described in the memoir was a fake—purely and simply a fake. Yeast cannot be produced under the conditions of that section! If those of my hearers or any other physician having some knowledge of physiological chemistry will take the pains to read this section of Pasteur's memoir with attention, he will see for himself that yeast cannot be so produced, and he can prove it by making the experiment as described.

Now mark what, supposing I am right in this, this memoir does prove. It proves that Pasteur was so ignorant of physiological chemistry that he believed yeast could be so produced, or else he was so confident of the ignorant confidence of the medical profession in himself, that he believed he could bluff it through. In this last belief, he was correct for a time. I cannot but believe that the exposure I am making of Pasteur's ignorance and dishonesty will lead to a serious overhauling of all his work.

It was Bechamp who discovered and expounded the theory of antisepsis which Pasteur permitted to be ascribed to himself. In his 'Studies on Fermentation,' Pasteur published a letter from Lord Lister, then Mr. Surgeon Lister, in which

that gentleman claims that he learned the principles of antisepsis from Pasteur. I do not doubt this statement of the noble Lord, for besides accepting Mr. Lister as a gentleman of veracity, I will give you an additional reason for accepting that statement.

***Lister's Blunder**

When Mr Lister began his antiseptic operations, they were generally successful, but a few days later his patients succumbed to carbolic acid or mercuric poisoning, so that it became a gruesome medical joke to say 'The operation was successful, but the patient died.'

Now Mr Lister, though a very skilled surgeon and, I believe, having great powers of observation, had established the technique of his operations upon the teachings of a man who had plagiarized the discovery without understanding the principle upon which it was based. Not unnaturally, Lister used doses of carbolic acid, which, when placed upon an open wound or respired by a patient were lethal. But, thanks to his careful observations, he gradually reduced the quantity of carbolic acid or sublimate of mercury employed, until at last 'his operations were successful and the patients lived,' as they would have done from the beginning, had he obtained his knowledge of the principles of antisepsis from their discoverer, who had warned against the use of any but a very minute dose of carbolic acid, instead of from their plagiarist, who did not know why the dose should be so limited.

From the outline I have now given you, you may form some idea of the ignorance of the man who, for more than thirty years, official medicine has been worshipping as a little god. But this is only a small part of the mischief perpetrated. Instead of making progress in therapeutics during the past thirty or forty years, medicine—outside of surgery—has fearfully retrograded, and the medical profession today is, in my judgment, in a more degraded condition than ever before in its history. I know that at first your minds will rebel against this statement, but some facts will prove to every mind possessed of common sense that it is true."

The Danger of Inoculating

After discussing the practice of medicine in the past and saying that since Jenner's and Pasteur's days the modern effort is to make sick well, he says of

inoculations:

"When a drug is administered by the mouth, as was beautifully pointed out by Dr J. Garth Wilkinson, in proceeding along the alimentary canal it encounters along its whole line a series of chemical laboratories, wherein it is analysed, synthesized, and deleterious matter prepared for excretion, and finally excreted, or it may be ejected from the stomach, or overcome by an antidote.

But when nature's coat of mail, the skin, is violated, and the drug inserted beneath the skin, nature's line of defence is taken in the rear, and rarely can anything be done to hinder or prevent the action of the drug, no matter how injurious, even fatal it may be. All the physicians of the world are incompetent either to foresee its action or to hinder it. Even pure water has been known to act as a violent and foudroyant poison when injected into the bloodstream. How much more dangerous is it, then, to inject poisons known to be such, whether modified in the fanciful manner at present fashionable among Vivisectionists or in any other manner. These simple considerations show that inoculation should be regarded as malpractice to be tolerated only in case of extreme danger where the educated physician sees no other chance of saving life.

The Germ Theory Fetish

Now the forcing of these inoculations upon individuals by law is one of the worst of tyrannies imaginable, and should be resisted, even to the death of the official who is enforcing it. English speaking people need to have ideals of liberty refreshed by a study of the history of Wat Tyler, who headed one of the most justifiable rebellions in history, and although treacherously murdered by the then Lord Mayor of London, his example should be held up to all our children for imitation..."

But *revenous a nos monutous*; the entire fabric of the germ theory of disease rests upon assumptions which not only have not been proved, but which are incapable of proof, and many of them can be proved to be the reverse of truth. The basic one of these unproven assumptions, the credit for which in its present form is wholly due to Pasteur, is the hypothesis that all the so called infectious and contagious disorders are caused by germs, each disease having its own specific germ, which germs have existed in the air from the beginning of things, and that though the body is closed to these pathogen's germs when in good health, when the vitality is lowered the body becomes susceptible to their

inroads."

I agree most heartily with Dr Levenson's statement that "the forcing of these inoculations upon individuals by law is one of the worst tyrannies imaginable, and should be resisted even to the death of the official who is enforcing it." Strong words, but absolutely right!

Professor F. W. Newman of Oxford University has said:

"Against the body of a healthy man Parliament has no right of assault whatever under pretence of the public health; nor any the more against the body of a healthy infant. To forbid perfect health is a tyrannical wickedness, just as much as to forbid chastity or sobriety. No lawgiver can have the right. The law is an unendurable usurpation, and creates the right of resistance."

And Blackstone says:

"No laws are binding upon the human subject which assault the body or violate the conscience."

In the case of the Union Pacific Railway vs Botsford, the United States Supreme Court said:

"...no right is held more sacred or is more carefully guarded by the common law than the right of every individual to the possession and control of his own person, free from all restraint or interference of others, unless by clear and unquestioned authority of law.

As well said by Judge Cooley:

"The right of one's person may be said to be a right of complete immunity; to be let alone." (Cooley on Torts 29)

"The inviolability of the person is as much invaded by a compulsory stripping as by a blow. To compel anyone, and especially a woman, to lay bare the body or to submit it to the touch of a stranger, without lawful authority, is an indignity, an assault, and a trespass." (141 U.S. 250)

In 1903 Judge Woodward of the New York Appellate Court said in the Viemeister case:

"It may be conceded that the legislature has no constitutional right to compel any person to vaccination." (84 N.Y. Supp.712)

In the Supreme Court, Columbia County, N.Y., in 1910, Judge Le Boeuf, in the second trial of the Bolinger case, instructed the jury as follows:

"Now I have charged you that the assault which is claimed to have existed here due to the forcible vaccination, that is, if it was against this man's will, is one which you must consider. And the reason of that is: This man, in the eyes of the law, just as you and I and all of us in this courtroom, has the right to be let alone. We all have the right to the freedom of our persons and that freedom of our persons may not be unlawfully invaded. That is a great right. It is one of the most important rights we have."

I believe these quotations from court documents indicate clearly that anyone has a right to protect himself or his family from the pus-squirters of the A.M.A. by any means that may be available, and use as much force as may be necessary, even, as Dr Levenson says, "to the death of the official who is enforcing it."

Over 60 years ago the famous English physician, Dr Charles Creighton, said in *Jenner and Vaccination* (1879):

"The anti-vaccinists have knocked the bottom out of a grotesque superstition." However, it has been revived, and needs some more 'knocks'.

The doctors will not willingly give up such a lucrative practice as the use of biologicals, and so parents and the public must do something to stop this blood poisoning. What will it be?

I have seen a little girl, upon being vaccinated (or 'inoculated'), go to school, promptly develop 'leaky heart valves' and die of 'heart trouble' about two years later, hardly ten years old. I don't believe that either her parents, schoolmates, or teacher, or even the doctor concerned, saw any connection between the vaccination, or inoculation, and the leaky heart valves—but there was a connection—see my pamphlet *The so-called Biologicals have Created a New Form of Heart Disease*.

And thousands of such deaths are caused every year. What are we going to do to

stop it?

In the whole history of mankind, the only adequate answer to tyranny humanity has had has been death to the tyrant; and the A.M.A.-ites have been tyrannical in their efforts to sell their decayed animal pus biologicals for many years. I believe that if these efforts at compulsion, coercion or compulsory laws to force the use of any kind of biological or so-called "tests" of any kind are pushed much further, they will lead to trouble.

As we show in this book, the underlying "germ theory" is a fraud, and everything based on it is also fraudulent, and should be forbidden by law; and when the public fully realizes what a colossal fraud the use of these decayed animal pus concoctions is, you won't even be able to jail a man for shooting a pus doctor who tries to vaccinate, inoculate, or 'test' his children.

We will outline, further on, a safe method of controlling infections.

Dr Levenson goes on to describe disease as nature's attempt to eliminate waste, and diseased tissues as being due to improper living; and suggests plenty of fresh air, the best of sanitation, very scanty clothes such as gymnasium costumes for everyday use, and a scientific study of diet; he believes overeating causes "an enormous number of diseased conditions".

All of these ideas would undoubtedly lead to better health and longer life than can be obtained through serology.

It is now over 30 years since Dr Levenson expressed the hope that his "exposure" would lead to a "serious overhauling" of Pasteur's work, and it should be done by someone who understands physiological chemistry.

I feel as he seems to—that the allopathic mind is hardly to be trusted with such important work!

CHAPTER 7

ARE BIOLOGICALS INJURIOUS

The 11th Report of the Medical Officer of the Privy Council of England (1868) contains a paper by Dr Burdon Sanderson entitled "On the Inoculability and Development of Tubercles" (p.91). In this he describes experiments he made which proved to his satisfaction that tuberculosis often followed the inoculation of animals with various materials (mostly biological) from non-tubercular sources, and that even a wound might be followed by tuberculosis. He says in part (p.92):

"The facts from which I had concluded that tuberculosis may originate traumatically, although very limited in number, were so positive in nature that I ventured to state that the results of tuberculosis inoculation could be no longer regarded as necessarily dependent on any property or action possessed by the inoculated material in virtue of its having been taken from a tuberculous individual. The truth of this inference has now been completely established by the experiments of two of the most competent observers, Dr Wilson Fox, Professor of Clinical Medicine in University College and Dr Cohnheim of Berlin. The following paragraph contains a summary of their results, which are the more valuable as they were arrived at altogether independently and without knowledge either of each other's inquiries or mine.

From the tabular summary of Dr Fox's experiments (117 in number) it appears that of 70 animals inoculated with various products derived from the bodies of non-tuberculous patients, about half (34) became tuberculous. In addition, five animals were inoculated with putrid but originally healthy muscle, and four of them became tuberculous, as was found when they were killed at various periods from 84 to 122 days after inoculation. Of seven animals in which setons or other mechanical irritants were introduced under the skin, two became tuberculous. This research, no less remarkable for the accuracy and completeness of the anatomical details, than for the conclusiveness of the experiments, was followed only the other day by another in Berlin, which although of similar nature, appears by internal evidence to have been conducted in entire ignorance of the fact that several of the questions investigated had already been completely settled in England.

Drs Cohnheim and Frankel, to establish whether artificial tubercle owe its origin to a specific virus, introduced into the peritoneal cavities of guinea pigs portions of various tumours (carcinoma, sarcoma, condyloma, etc.) as well as portions of healthy but partly decomposed tissue. Subsequently they employed in the same way a variety of insoluble inert substances such as blotting paper, charpie, gutta percha, caoutchouc, vulcanite, etc. In those animals that survived the immediate effects of the injury, emaciation supervened sooner or later and the animal eventually died with tuberculosis of the peritoneum, liver, spleen, lungs, and other organs, the morbid appearances corresponding in every respect with those described in my last report.

As regards the bearing of these facts on the general question of the nature and origin of tuberculosis; I concluded from my own observations that there is no structural distinction between the artificial disease and human tubercle, so long as the term is confined, as all accurate writers are now accustomed to confine it to military tuberculosis; but I considered it necessary to maintain a reserve as to its relation with the many pathological processes which are spoken of as tuberculosis in the common language of practical medicine and surgery.

In going so far the two distinguished pathologists already quoted have fully agreed with me. Dr Fox says:

"I must confess that sceptical as everyone must naturally at first feel on this subject, the cumulative force of the evidence in favour of the tubercular nature of these growths appears to me irresistible. We are either dealing with tubercle, or we have before us a new and hitherto unknown constitutional disease of the rodentia, consisting of growths which, to the naked eye and in their histology, correspond with all the essential features of tubercle in man; which occur not only in the organs which are the chosen seats of tubercle in man, but also in the same parts of those organs; which have the same vital characters, and the same early degenerative cheesy changes, not suppuration nor acute softening, and with no marked characters sufficient to distinguish them from tubercle."

Cohnheim says, "All the marks by which tubercle is characterized are present; the agreement of the product of inoculation with human military tubercle could not be more complete than it is, whether regard be had to its extended distribution and to the great variety of organs affected, (peritoneum, pleura, lungs, liver, spleen, lymphatic glands, and even the choroid), or to its

macroscopic and microscopic characters."

Gould, in the second edition of his *Pocket Cyclopædia of Medicine and Surgery* describes "acute miliary tuberculosis" as:

"An acute and rapid form of tuberculosis, which generally occurs in persons under 15 years of age, and in which the tubercle bacilli are rapidly disseminated through the body by the breaking down of some localized form of the disease ... the duration is from 2 to 4 weeks and the termination is fatal."

Or, could not this "localized form" be introduced by a needle, in the way Dr Sanderson describes? Are not "persons under 15" the school doctor's best customers for their so-called biologicals? And does not this "rapid dissemination through the body" sound remarkably like de Kruif's description of the way in which Koch's tuberculous germs spread through his guinea pigs? Miss Hume says in *Bechamp or Pasteur?*:

"It is noteworthy that neither Pasteur nor any of his successors have ever induced a complaint by the inoculation of air-carried bacteria, but only by injections from bodily sources."

I believe this would account for a very large part of our "miliary tuberculosis" in persons under 15; undoubtedly it followed the injection of some biological! And Miss Hume's description would include all biologicals of every description!

Dr Sanderson continues:

"My further inquiries lead me to believe, in the first place that these characters belong much more generally to tuberculous growths than I had at first supposed; and secondly, that those normal tissues which possess them are much more liable to become the seat of the tuberculous process than others."

This is probably the most striking evidence in print that almost any sort of inoculation can cause tuberculosis in the animal inoculated, and of course it is reasonable to deduce from this that the same non-tuberculous inoculations would cause tuberculosis in man, any man, and in all probability, from any biological product whatsoever! Yet the ignorant serum doctor will tell us that these products are perfectly harmless!

TUBERCULIN A FRAUD

The above article, which from the day it was first printed should have forever stopped the use of all biologicals on humans, was published over 20 years before Robert Koch of Berlin brought out his Tuberculin (in 1890), which proved such a terrible failure!

The Zoophilist for May 1st 1891 reported deaths in 123 "selected" cases in Berlin from November 1890 to February 1891 which caused Koch to fall "under a cloud", but he did not give up until the government finally closed him up because of the terrible death rate!

Dr Paul de Kruif describes this work of Koch's on the tuberculosis germ in rather lurid language, yet recent efforts to produce a serum for tuberculosis seem to justify his words. He says of Koch's search for the microbe:

"I have it!" he whispered, and called the busy Loeffler and the faithful Gaffhy from their own spying on other microbes.

"Look," Koch cried, "one little speck of tubercle I put into this beast six weeks ago— there could not have been more than a few hundred of those bacilli in that small bit—now they've grown into billions! What devils they are, those germs— from that one place in the guinea pig's groin they have sneaked everywhere into his body, they have gnawed, they have gone through the walls of his arteries...the blood has carried them into his bones...into the farthest corner of his brain..."

Read that over when your child brings home a card from school requesting permission to put the same sort of stuff into his blood, and tear up the card! He says that Koch found and grew different families or varieties of these deadly germs. I believe that by the doctors' standards at least, this would necessitate 43 different serums to immunize one against all 43 families, and this is probably not all the varieties there are of tuberculosis germs alone!

However, de Kruif passes over tuberculin with astonishing brevity, considering the space given to other matters that were of less importance. He says apologetically:

"...he was enormously respected, and against his own judgement he was trying to convince himself he had discovered a cure for tuberculosis. The authorities (scientists have reason occasionally to curse all authorities, no matter how

benevolent) were putting pressure on him. At least so it is whispered now by veteran microbe hunters who were there and remember those brave times.

'We have showered you with medals and microscopes and guinea pigs—take a chance now and give us a big cure, for the glory of the fatherland, as Pasteur has done for the glory of France!' It was ominous stuff like this that Koch was always hearing. He listened at last, and who can blame him, for what man can remain at his proper business of finding out the ways of microbes with governments bawling for a place in the sun—or with mothers calling? So Koch listened and prepared his own disaster by telling the world about his Tuberculin."

And here de Kruif changes the subject very abruptly! On page 299 he refers to it again, in discussing malaria, as follows:

"Dean of the microbe hunters of the world, Tsar of Science (his crown was only a little battered) Koch had come to Italy to prove that mosquitoes carry malaria from man to man.

Koch was an extremely grumpy, quiet, and restless man now; sad because of the affair of his consumption cure (which had killed a considerable number of people)...so Koch went from one end of the world to the other, offering to conquer plagues but not quite succeeding."

Neither are his successes in the use of serums, nor is there any likelihood of success in that direction, as we hope to show.

J.W. Browne, B.A., M.B., Medical Superintendent of the Kalyra Sanatorium, South Australia, quotes Koch at length to the effect that, while an injection of tuberculin into a healthy person will probably start a tubercular sore, an injection into anyone already infected will counteract or 'kill' the first infection, without doing anything more!

Note that he admits that it causes tubercular sores in the well! Hence you'd better know whether you have tuberculosis or not before you take it!

However, this reversible characteristic of making the well sick, and the sick well, existed only in Koch's imagination, as is indicated in his own work. Anyone with such a belief must be credited with care in giving such stuff only to tubercular people, and those who received it died so fast the government had to close him

up! Incidentally, cattlemen have contended for many years that it made healthy cattle tubercular.

Dr Browne says:

"Up to date upwards of two hundred different forms of tuberculin have been prepared and described. The simple fact of the matter is that no one has yet been able to repeat Koch's experiment successfully.

"There is no evidence but Koch's in favour of tuberculin as a therapeutic cure for tuberculosis in guinea pigs, in calves, or in man. No one but Koch has been able to cure an infected guinea pig by the use of tuberculin of any sort or description. Koch, as Shera says, was an optimist. There is no question that tuberculin can do infinite harm. Scores of people have died prematurely at its hands. **Never was there such a commercial vaccine as this one, and never has there been such a gigantic hoax.**

Tuberculin, Shera says, should not come within the range of vaccine therapy. Whatever good results are imputed to tuberculin must have occurred in spite of it, for its virtues are founded on experiments which cannot be repeated.

"The disbeliever too, can point to many cases where the administration of tuberculin in pulmonary disease has been undoubtedly followed by disaster and, while he freely admits the undoubted powers of the tuberculin therapist to stir up the embers and kindle the fire, he has hitherto asked him in vain for any evidence of power to extinguish the fire."

He (rightly, I believe) considers pulmonary tuberculosis to be at least in part "and to a greater or less extent" a septicemia, and adds:

"The failure of vaccines to affect the disease in any but an adverse manner is thus explained. As we all know vaccines have invariably been found useless or worse than useless in septicemias."

Such statements, coming from a physician of Dr Browne's experience, should write finis on the use of tuberculin as a cure forever; and it is no better as a 'test'.

Drs Petroff and Branch, in a discussion of the B.C.G. vaccine used on children, finds that tuberculin seems to spread tuberculosis in those who have the latent or 'benign' form which vaccination is supposed to give.

Note also that the tuberculin seemed to spread tuberculosis in these cattle 'tests' as it did in Koch's experiments on humans. They say:

"Tzekhnovitzer claims that guinea pigs become hypersensitive to tuberculin after treatment with B.C.G...70% of those infected orally and 45% of those infected by the subcutaneous route react.

IMMUNITY IN ANIMALS VACCINATED WITH B.C.G.

"Guerin, Richart and Bossiera studied a large number of cattle on a farm. On this farm in 1915 in a herd of 67 head, 47% reacted positively to the tuberculin test. Year after year, the positive animals were slaughtered. In 1918, 38% were still positive to the tuberculin test. In 1920, the number of reactors was 41.7%.

Vaccination in the newborn cattle started on Jan. 1, 1921. In 1922, one year after the vaccination, 20 cattle gave a definitely positive and nine a very suspicious tuberculin reaction, or a total of 45% of 64 head. Many of these animals were vaccinated and revaccinated. In 1923 there remained 26 of the 1919-1920 year animals, all giving a positive tuberculin reaction."

Note that after 47% were slaughtered in 1915, as were all animals testing positive in the following years, 38% were tubercular in 1918, and a full 100% of those animals which remained from the 1919-20 vaccinated group all gave a positive 'test'. This was undoubtedly due either to the vaccines used or the 'tests' themselves, which confirms the opinions of the authorities quoted above! Could any dairyman survive such a loss?

They continue:

"In the meantime, the second generation of these vaccinated animals were revaccinated, and the vaccination repeated each following year...there is no record of how many of the vaccinated cattle became infected, as the tuberculin test was omitted on Calmettes' suggestion, as he believes that it is of doubtful value, giving no information as far as exogenous (outside) infection is concerned.

Furthermore if in the vaccinated cattle an implantation of virulent organisms has taken place, setting up only a benign tuberculosis, tuberculin administered may bring about a violent allergic reaction disseminating the virulent organisms. In such an event, progressive disease may follow...

Gradually the animal becomes resistant to this particular organism. However, as soon as a new organism is introduced into the herd, the occurrence of the disease is much more marked than before."

They do not mention the fact that these "implantations" may also occur in your child; nor do they realise that they can come through a change of the germ in the vaccine, but such is the case, as I showed in Germ Mutation (now out of print).

As occurred with 'flu' in the war, which was merely a mutation of the typhoid germ in the vaccines used against typhoid and paratyphoid, every vaccine may produce a 'new' form of germ which, as noted above, may "make the occurrence of the disease much more marked than previously".

This is why we had the 1918 flu epidemic, with the highest death rate on record. It is the reason Koch had so many deaths, and also the reason for the large increases in the death rates of other diseases as noted in Chapter 9.

Koch found 43 varieties or strains of tuberculosis and there are probably as many strains of any other disease. The very multiplicity of these strains, and the ease with which modification can occur on the shelf or in the tissues, is the fundamental reason why biologicals can never be used successfully.

F. Loehnis, soil biologist, and N.R. Smith, U.S. Department of Agriculture, have discussed this variability of germs at considerable length and conclude that any germ can break down into a filterable fluid and then develop into new forms that may be radically different from the original germ, their new characteristics depending mostly upon their environment. They believe this change is constantly going on in all groups of germs.

Hence new strains are always being formed and are usually more virulent than the old.

Doctors Petroff and Branch add:

"It seems that in spite of the vaccinations with B.C.G., and the sociological measures, the implantation with violent tubercle has taken place.

Lakhms of Lithuania, studying 472 vaccinated infants, reports that he obtained 10 times more positive reactions in the vaccinated children than in the unvaccinated."

The real fact is that tuberculin never had any diagnostic value. It was not offered as a test on animals until its failure as a cure on humans caused the German government to forbid such use; in other words, the manufacturers 'discovered' or invented this new use for it to preserve a market. The 'test' on cattle circumvented both the prohibition and its ill-repute as a cure, thus continuing the profits, which is all it is good for.

Read the account of the United States Agricultural Department's 'tests' on animals infected with the hoof-and-mouth disease from vaccines, in Chapter 8.

In Fasting and Man's Correct Diet, The Tuberculin Test a Fraud (out of print), Immunity (also out of print), and Drugless Cures, I give additional evidence that the use of tuberculin was a fraud, utterly useless, and that more recent serums are no better.

BIOLOGICALS MAY DISSOLVE THE RED BLOOD CORPUSCLES

It has also been found that the soluble ferments of many animal serums will, in some humans at least, dissolve the red blood corpuscles.

Elie Metchnikoff, the famous Russian scientist, says:

"It has long been known, however, that the serum of the blood of many animals will destroy the red corpuscles of a different species. This demonstration was afforded during the period when attempts were being made to transfuse the defibrillated blood of mammals, especially of the sheep, into man. This practice had to be abandoned in consequence of the difficulties resulting from the solution of the human red corpuscles."

Later, Buchner compared the action of alexine (the name given to the substance found to cause this action) to that of soluble ferments and referred it to the category of the digestive diastases."

This alexine is probably the same thing described by Bechamp as the liquid ferment mentioned in Chapter 2, and it should not destroy or even injure perfectly healthy blood or tissues, but who is perfectly healthy?

Dr M. R. Levenson says in the preface to his translation of *The Third Element of the Blood* that Bechamp isolated a series of soluble ferments which he called zymases, but which plagiarists renamed diastases to obscure his discoveries. Likewise, Bechamp discovered the reason for the coagulation of the blood.

Metchnikoff continues:

"According to him the same alexine is capable of dissolving the red blood corpuscles of several species of vertebrates. Bordet, 56 in a series of researches made in the Pasteur Institute, confirmed this view. He came to the conclusion that the alexines of the various species of animals differ from one another. Thus the alexine of the blood serum of the rabbit is not the same as that found in the serum of the guinea pig or dog. Nevertheless each of these alexines is capable of exerting a solvent action on the red blood corpuscles of several species."

He continues, on page 95:

"It may, however, be admitted that the action of alexine (complement) comes under the category of phenomena that are produced by soluble ferments. The substance which dissolves the red blood corpuscles of mammals or a portion only of those of birds, undoubtedly presents great analogies to the digestive ferments. As has been mentioned repeatedly, it is very sensitive to the action of heat and is completely destroyed by heating for one hour at 55 degrees (C). In this respect, it closely resembles the macrocytase of macrophagic organs which also dissolves red corpuscles. As it is the macrophages which ingest and digest the red blood corpuscles in the organism, it is evident that alexine is nothing but the macrocytase which has escaped from the phagocytes during the preparation of the serums."

On page 401 of the same book, discussing artificial immunity against toxins rather than microbes, he says:

"When microorganisms, living or dead, are introduced into an animal, it is found that anti-toxins do not as a rule, appear in the fluids; in these cases, the reaction is set up mainly by the microphages. The microphages represent the principal

source of anti-toxins."

Is this point clear? All animal blood serums can dissolve the red blood corpuscles of several other species of animals, and many of them, for example that of the sheep, can dissolve the red blood corpuscles of man!

It is also possible that due to the wide variations in the character of the blood and blood serum, etc., both in the animals used and in the patients treated, due to both individual and possibly also racial differences, the serum from any particular animal might have a very injurious effect on the blood or other body fluids of a percentage of human patients treated, as indicated by the many deaths that follow the use of anti-toxin, even though it might not be injurious to all.

Note that they compare this stuff to a soluble ferment, which can go through a china filter, and eat red blood corpuscles, pink dynamite and other things; and this is "the principal source of anti-toxins."

It may be true that most horses' blood serum will not dissolve human red blood corpuscles, but how can we know, with all the variations possible, both in the horse, and in man, that some particular horse serum will not dissolve the red blood corpuscles of one or more children in any school which the serum squirters choose to 'protect', as they call it?

This might be the direct cause of the tuberculosis discussed above, and many other troubles that often follow the vaccination of thousands of children, and others.

We quoted Professor Bechamp as to the amount of material a solvent ferment can digest in Chapter 2, and Bechamp and other authorities say that a solvent ferment will survive much higher temperatures than 55 degrees C. This danger, therefore, exists in almost every biological on the market!

There is also the danger that some serum might contain the alexine of some animal other than a horse, which could be even more dangerous.

Furthermore, even though a serum cannot dissolve the red blood corpuscles, it might dissolve the leucocytes, the so-called white corpuscles, and this tendency seems to be much more common; in fact, it seems to be the basis of the process of artificial immunity!

For instance, Metchnikoff says:

"When into the peritoneal cavity of vaccinated guinea pigs a certain quantity of cholera culture containing virulent and very motile vibrios is injected, we find that in the peritoneal fluid drawn off by means of a fine pipette, the vibrios have undergone profound changes in the refractory organism. Even a few minutes after the injection of the vibrios, the leucocytes disappear almost completely from the peritoneal fluid; and only a few small lymphocytes and a large number of vibrios, the majority of which are already transformed into granules, are found; and there is presented a most typical case of Pfeiffer's phenomenon.

Alongside the round granules may be seen swollen vibrios, and others which have kept their normal form, but all are absolutely motionless. Some of these granules are gathered into small clumps, others remain isolated in the fluid. When to the hanging drop containing these transformed vibrios a small quantity of a dilute aqueous solution of methylene blue is added, we observe that certain granules stain very deeply, while others take on merely a very pale tint, scarcely visible. Many of these granules are still alive, because it is easy to watch them develop outside the animal and elongate into new vibrios. A large number of the granules, however, no longer exhibit any signs of life and are evidently dead.

R. Pfeiffer and certain other observers affirm that the granules may be completely dissolved in the peritoneal fluid just as a piece of sugar dissolves in water. We have repeatedly sought for this disappearance of the granules in hanging drops of the peritoneal fluid, without being able to find any diminution in the number of these transformed vibrios, even after several days. Nor have we been able to observe the phenomenon of the solution of the granules. It is, at any rate, indisputable that this granular transformation is a manifestation of very profound lesions undergone by the cholera vibrios under the influence of the peritoneal fluid of the immunized animal.

On the other hand, one is compelled to the conclusion that the granular transformation is due, as we shall see later, to a fermentative action of the peritoneal exudation."

Some authorities have considered the leucocytes to be an essential part of the blood, in which case their dissolution should be a dangerous loss to the person concerned. In my opinion, however, the leucocytes are nothing more than body waste or refuse in the process of elimination, and their dissolution immediately places a liquid toxic poison in the blood with no means of preventing it being

absorbed, wherever the blood goes, into any and all tissues. Hence the possibility that the brain, the heart, or other organs not intended to handle these toxic poisons might absorb some of them.

Have you ever seen two leucocytes that were the same size or shape? They appear to vary widely in both characteristics—looking, in fact, more like crumbled cheese than living tissues.

GERMS IN SERUMS MAY ATTACK THE HEART VALVES

Other authorities have described other dangers in the use of serums, for instance Dr E. C. Rosenow, then of the Mayo Clinic, said over 25 years ago that certain varieties of germs in serums used in his experiments had "an affinity for the heart valves"!

He describes experiments in which he found that the green producing variety of germs in the serums attacked the valves of the heart, while a certain hemolyzing variety attacked the body joints, thus causing rheumatism!

In November 1925, the Chicago Health Department stated that:

"...more children of the ages of 10 to 14 die of heart disease in Chicago than of all other children's diseases put together!"

If Dr Rosenow's statements are true, do you wonder that Chicago children are dropping dead on the street, with all the serumization that is practised in our schools? In the olden days, it was very rare for a child of 10 to 14 years of age to die of heart disease.

Dr Frederick Hoffman, LL.D., Consulting Statistician of the Prudential Insurance Company of America, said:

"Heart diseases in all civilized countries are the leading cause of death and of a vast amount of physical impairment. As far as it is possible to judge, the relative frequency of heart disease in proportion to population has everywhere been increasing during the last two decades, although evidence to this effect is more or less conflicting."

While most diseases that kill mankind off have gone down at an almost wonderful pace since sanitation was first introduced to the world, this particular one is increasing, for some reason the authorities profess not to understand.

Note that those immigrants from countries having compulsory vaccination die off at a rate three to four times higher than immigrants from countries not having compulsory vaccination.

There is no doubt that there are other causes to be considered, such as sanitation, living conditions, diet, and that the relative vitality of the different races may vary, so why should these death rates seem to divide simply on their vaccinal conditions? And granting this, why does heart disease lead all other diseases in the difference between the high rates and the low?

It seems to me that this chart alone is very conclusive evidence that the statements we have quoted in this chapter, as to biologicals causing both tuberculosis and heart disease, are correct.

In regard to Italy, which passed a law for the compulsory vaccination of infants in 1888, we still class it in the 'without' column, because in 1910, the time of this census, probably not over 25% of the immigrants in New York State would be under 22 years of age and thus affected by the law, and it is very likely that the law was inefficiently enforced for the earlier years, thus allowing many to escape. Furthermore, all of those vaccinated would still be too young for the full effects of any injurious biologicals to become fully developed by 1910, hence Italy's inclusion in the unvaccinated column.

Statistics of later years seem to indicate that Italy now has death rates comparable with other countries having compulsory vaccination, which can only serve to strengthen the idea that the fad for serums is the cause!

Dr Rosenow also speaks of other troubles that may follow the use of biologicals. In a series of articles based on the influenza epidemic of 1918 and published in The Journal of Infectious Diseases, and also in the Collected Papers of the Mayo Clinic, Vols 10, 11, and 12, he describes many changes in serums or in patients which rendered the serum useless.

In Vol. 10, page 919, he observes of the pneumococcus streptococcus group, of which he thought mutation forms were responsible for the 1918 pandemic:

"...marked changes in morphology, growth characteristics, infective powers, and immunological reactions. Many of these changes appear to be true mutations." On page 949 of the same volume, he ascribed deaths following the use of certain serums to some change or mutation in either the serum or patient.

While, I believe, a serum is supposed to cure by 'agglutinating' all germs of that exact kind which it finds in the body, when there is a slight difference in germs, or changes occur, either in the patient's germs or in those in the serum, no "agglutination" takes place, and the patient is apt to die, unless sanitary or other measures are taken to save him.

Most regular physicians will say in such a condition that there is no hope, but if drugless physicians are called in, or if enemas are given, there is more than hope. In fact I believe two or three enemas a day and an exclusive fruit juice diet for a while would save the great majority of these cases.

However, this is not meant to be a discussion of the treatment of disease, which is covered in other books.

That this change or mutation of germs is a very serious handicap in treating diseases by means of serums or vaccines is indicated all through the series of ten papers that Dr Rosenow published in Vol. 12 of the Mayo Clinic papers.

He says in Vol. 12, page 920, that the serum used on some guinea pigs "tended to localize in the lungs".

In Vol. 12, page 1001, he says:

"Moreover, marked changes in the immunological condition as measured by agglutination tests have occurred in a number of strains following successive (intratracheal) animal passages."

He added that when the changes occurred, "no good effects were noted". If passage through animal tissue will cause "marked changes in the immunological condition", how can anyone know that passage through human tissues, for example from the arm into the body, will not do the same?

And where can you find a serum or vaccine that has not had an animal passage at some previous time? They are nearly all propagated in animals at present and a substantial percentage of all "passages" seem to cause a change. In table 4 he shows 35 changes in 44 cases, and one of the other nine had changed in a previous experiment; that makes changes in over 81% of the tests!

So you see, this change is no minor accident; in fact, it occurs with great frequency, as Bechamp proved many years ago.

And these changes in the germs mentioned are of vital importance, as they often merely substitute a new disease for the one vaccinated against.

Pasteur seemed to recognize the importance of this point as he vehemently denied its possibility to the very last, and made bitter personal attacks on Bechamp and other colleagues who opposed his ideas for this reason.

Now that this has been proven so overwhelmingly, we can see how a vaccine for any one disease could start some other disease through these mutation forms. We shall then need more serums for the new disease, or more likely, several new diseases may develop, and so on, ad infinitum.

In the pamphlets *Germ Mutation and Immunity, Artificial vs Natural*, I give some important evidence indicating that the 1918 influenza epidemic was caused by mutation in vaccines used to 'prevent' typhoid in the armies in Europe.

When they inoculated against typhoid, they soon found that they had a paratyphoid on their hands, and the percentage of paratyphoid in those inoculated was identical to the second decimal place with the percentage of typhoid in those not inoculated.

And when they gave two "shots", one for each of these, they discovered a second paratyphoid, so to be scientific they called them 'A' and 'B.'

And, as scientists must always be 'scientific', they then gave the boys three shots, one for each of the above diseases, whereupon they found a fourth 'disease'—influenza—and the world's highest recorded death rate at that! The Surgeon General of the A.E.F. said of this 'influenza':

"The ordinary clinical picture of typhoid paratyphoid is frequently profoundly modified in vaccinated individuals...intestinal types of supposed influenza should always be considered as possible typhoid until proven otherwise. Vaccination is a partial protection only, and must be reinforced by sanitary measures."

Furthermore, supposing that there is no change and that a serum or vaccine 'agglutinates' perfectly, what proof have we that it will either prevent or cure any

disease?

Elie Metchnikoff, says:

"The most carefully studied case of the relations between natural immunity and agglutination is of that encountered in the anthrax bacillus. We owe it to Gengou, who at the Liege Bacteriological Institute carried out a very detailed investigation of this question.

"He showed that the bacillus of Pasteur's first anthrax vaccine is agglutinated by the blood serum of a great number of animals. But he also showed that the serums which have the greatest agglutinative action on this bacillus do not come from the most refractory species. Human serum agglutinates most strongly the bacillus of the first vaccine (in the proportion of one part of serum to 500 parts of culture) but man is far from being exempt from anthrax.

"Pigeons' serum, on the other hand, is completely without any agglutinative power, although this species resists not only the first vaccine but very often virulent anthrax. The serum of the ox, a species susceptible to anthrax, is more agglutinative (1:120) than that of the refractory dog (1:100).

"All these facts fully justify the conclusion formulated by Gengou that we cannot establish any relation between the agglutinating power and the refractory state of the animals to anthrax...this conclusion may be extended to the phenomena of the agglutination of microorganisms and to those of natural immunity in general."

It is quite likely that most physicians will acknowledge that when the changes in a germ as described above occur, there is practically no possibility of it preventing or curing any disease, and while these changes may not run as high as 80% with all biologicals, nevertheless we have shown that it can and does occur with sufficient frequency to render all such methods utterly unworthy of confidence, and unfit to rely on to any degree.

And Professor Metchnikoff's statement that agglutination is of no value as an indication of immunity or curing power seems to wipe out any small remaining chance that serums can be beneficial, under any conditions.

In other words, it seems that when we get vaccinated and fail to catch any

disease afterwards, it is either only an accident, or is due more to our natural immunity than to the serum.

CHAPTER 8

ANIMAL SEROLOGY: ANTHRAX

Miss Hume says that a Frenchman named Delafond in 1838 announced that small rod-like objects were to be found in the blood of animals having splenic fever or charbon, now called anthrax, and when Pasteur brought out his one specific germ for each kind of fermentation, Devaine suggested that these little 'rods' which he named bacteridia might be parasites and the cause of the splenic fever. However, his experiments were contradictory and it was not proven. Later in 1878 Koch made some studies in which he discovered a formation of spores among his "bacteridia".

When Pasteur heard of this he declared:

"Anthrax is, therefore, the disease of the bacteridium, as trichinosis is the disease of the trichina, as itch is the disease of its special acarus."

He claimed that the blood of an animal vaccinated with anthrax serum contained no other organisms but the bacteridia. As he considered these exclusively aerobic, the blood must be imputrescible, because putrescence, he believed, was due solely to an anaerobic germ. (Later, when the Professors of the Turin Commission drew contrary conclusions from similar experiments, he charged that they had used sheep whose blood was "septic" as well as tainted with anthrax!)

He claimed that a mixture of aerobic germs, (the bacteridia) and anaerobic germs (of putrefaction) would "neutralize the virulence" of the bacillus anthracis and, if injected into animals, would protect them from infection.

In reality these two germs are only different developments or outgrowths of Bechamp's microzymas, and should have much the same effect anywhere, namely that of scavengers of dead tissues or waste. Their action should be similar, and not counteractant to each other, as is indicated in Chapter Two.

Dr Colin, another member of the Academy, promptly challenged Pasteur's statement on the grounds that anthrax was sometimes found in a virulent stage,

yet devoid of the "bacteridia".

In the next session (March 12, 1878) Dr Colin charged that Pasteur had suppressed two statements in the printed record that he had made on the floor during the prior session, i.e. "that the bacteridia of anthrax do not develop in the blood of healthy animals" and "that the bacteridia will not supply germs to the organisms," which left Dr Colin's criticism of these statements 'in the air', and, in addition, he charged that Pasteur had deliberately falsified the records of other criticisms Dr Colin had made; a nice charge to make against a 'scientist'!

On April 30, 1878, Pasteur read before the Academy of Science a paper entitled The Theory of Germs and their Application to Medicine and Surgery 67, which also bore the names of Messrs Joubert and Chamberlain as co-authors. This was his first effort to sell the 'germ theory'.

In this, among many false claims, was the statement that he had discovered "the fact that ferments are living beings", giving no credit to Bechamp whatever.

This paper also claimed that an infinitesimal quantity of their last produced culture was capable of producing anthrax with all its symptoms; yet their first experiments with it were failures, as the cultures, when sowed, produced a small spherical germ that was not even virulent, instead of the typical anthrax rods expected!

This was probably a true mutation but was not so recognized, the authors apparently believing it due to an impurity getting into their cultures.

The London Times of August 8, 1881, about three years later, quotes Pasteur as saying before a sectional meeting of an international medical congress in session there:

"...in the study of microorganisms there was an ever present source of error in the introduction of foreign germs, in spite of the precautions that might be taken against them. When the observer saw first one organism and afterwards a different one, he was prone to conclude that the first organism had undergone a change. Yet this might be a pure illusion...the transformation of a bacillus anthracis into a micrococcus did not exist."

Note that he said this 21 years after Miss Nightingale made her famous

statement that any germ could turn into another, as quoted on page five.

And when their own experiments failed to bear out their claims that their culture would produce anthrax or any of its symptoms, and the germs that were produced had no resemblance to the anthrax germ, either in appearance or virulence, why should others believe that they could prevent anthrax by any such "culture"?

But Paul de Kruif, in *Microbe Hunters*, a glorification of many famous pioneer serum faddists, paints a most astonishing picture of Pasteur's work on anthrax, and gives many startling details regarding the facts of the matter.

After describing the silk worm failure, he says:

"But one of Pasteur's most charming traits was his characteristic of a scientific Phoenix, who rose triumphantly from the ashes of his own mistakes...so it is not surprising to find him, with Reux and Chamberlain, in 1881 discovering a very pretty way of taming vicious anthrax microbes and turning them into a vaccine."

He describes Pasteur's demonstration of his anthrax vaccine at Pouilly-le-Fort, in May and June of that year in great detail, including the elaborate preparations, and he dwells on the fact that this experiment was framed by his enemies to destroy him, and that Pasteur realized that he was cornered, that he must succeed or else abandon his work on germs.

It seems to me that we have now seen too many cases of deceitfulness, prevarication and deliberate fraud on Pasteur's part to place much confidence in his good faith under such conditions, and in fact one is justified in looking with suspicion on this experiment. Here were 48 sheep—24 supposed to be vaccinated, lived, while 24 not vaccinated, died. In such a number the treatment might be differentiated quite easily.

He could have injected the unvaccinated sheep with a slow poison and he might have used pure sterile water, or a syringe with a perforated piston, in a pretended injection of the vaccinated sheep! And his assistants might have believed such a trick harmless and justifiable! Or it might have been concealed from them!

This 'miracle', as de Kruif describes it, seems to be the only success in a long series of failures; the one result that gives the only real support to Pasteur's

claims. After all the double dealing and fraud that we have proven elsewhere, are we not entitled to be sceptical of this? Does not his past conduct suggest that he could have been loading the dice? And he does not seem to have been able to repeat the success elsewhere!

De Kruif says of this fact (p.165):

Gradually, hardly a year after the miracle of Pouilly-le-Fort, it began to be evident that Pasteur, though a most original microbe hunter, was not an infallible god. Disturbing letters began to pile up on his desk; complaints from Montpotheir and a dozen towns of France, and from Packisch and Kapuvar in Hungary. Sheep were dying from anthrax—not natural anthrax they had picked up in dangerous fields, but anthrax they had got from those vaccines that were meant to save them! From other places came sinister stories of how the vaccines had failed to work—the vaccine had been paid for, whole flocks of sheep had been injected, the farmers had gone to bed breathing 'Thank God for our great man Pasteur', only to wake up in the morning to find their fields littered with the carcasses of dead sheep, and these sheep—which ought to have been immune—had died from the lurking anthrax spores that lay in their fields.

Pasteur began to hate opening his letters, he wanted to stop his ears against snickers that sounded from around corners, and then—the worst thing that could possibly happen—came a cold, terribly exact, scientific report from the laboratory of that nasty little German Koch in Berlin, and this report ripped the practicalness of the anthrax vaccine to tatters. Pasteur knew that Koch was the most accurate microbe hunter in the world!

There is no doubt that Pasteur lost some sleep from this aftermath of his glorious discovery, but God rest him, he was a gallant man. It was not in him to admit, either to the public or to himself, that his sweeping claims were wrong.

What a searcher this Pasteur was, and yet how little of that fine selfless candour of Socrates or Rabelais is to be found in him. But he is not in any way to be blamed for that, for while Socrates and Rabelais were only looking for truth, Pasteur's work carried him more and more into the frantic business of saving lives, and in this matter, truth is not of the first importance.

In 1882, while his desk was loaded with reports of disasters, Pasteur went to Geneva, and there before the cream of disease fighters of the world, he gave a thrilling speech, with the subject: How to guard living creatures from virulent

maladies by injecting them with weakened microbes.

And according to de Kruif, Koch made a devastating attack upon Pasteur's statements in a paper published shortly after this, in which he charged that practically all of Pasteur's claims for his anthrax vaccine were false, that his vaccines were not pure, that he had concealed the bad results that had followed the wholesale use of the vaccines, and he closed with:

"Such goings-on are perhaps suitable for the advertising of a business house, but science should reject them vigorously." (p.168)

De Kruif adds:

"Then Pasteur went through the roof and answered Koch's cool facts in an amazing paper with arguments that would not have fooled the jury of a country debating society."

How can de Kruif so praise a man, and describe the 'miracle of Pouilly-le-Fort' as "amazing as any of the marvels wrought by the Man of Galilee", after giving such devastating evidence that his work was a failure, his ideas false, and the man himself deliberately dishonest, making false claims and concealing the extent of his failures?

In 1881 the Sanitary Commission of the Hungarian Government said of the vaccine viruses used in the anti-anthrax inoculation:

"The worst diseases, pneumonia, catarrhal fever, etc., have exclusively struck down the animals subjected to injection. It follows from this that the Pasteur inoculation tends to accelerate the action of certain latent diseases and to hasten the mortal issue of other grave affections."

Plainly it failed in their tests also, and the Hungarian Government forbade its use in that country.

It was not long before his vaccine was proven a failure elsewhere as well. In March 1882, a commission composed of members of the faculty of the University of Turin, Italy, undertook to conduct tests regarding the value of this anthrax prophylactic. A sheep having died of anthrax, after the learned

professors had vaccinated some other sheep with Pasteur's cultures, they inoculated both these vaccinated sheep and some unvaccinated sheep with the blood of the dead sheep. All of the sheep, both vaccinated and unvaccinated, subsequently died, proving the vaccine utterly worthless.

After about a year of dispute and passing the buck by correspondence, the Turin professors published a pamphlet in June 1883, containing some of Pasteur's contradictory statements together with their cutting criticisms thereof, under the title *Of the Scientific Dogmatism of the Illustrious Professor Pasteur*, which was signed by six professors of high standing. This, by citing contradictory statements Pasteur had made in different papers, along with their comments, just about destroyed his theories on anthrax.

This paper was translated into French, but Pasteur, with some adroit dissimulation, managed to survive the blow, and went on pushing his anthrax vaccine.

He soon had bacteriological institutes for experiments and the production and sale of his various serums and vaccines established in many parts of the world, the one in Paris being probably the first.

In 1888 an institute in Odessa, Russia, sent some anti-anthrax vaccines to Kachowka in southern Russia, where 4,564 sheep were soon vaccinated, and 3,696 of them promptly turned up their toes and died; a death rate of 81%, and from a supposed 'preventative' vaccine at that!

Dr Lutaud says in *Etudes sur la Rage* (p.419) that Pasteur was compelled to compensate many owners in France for animals killed by his vaccines.

FOOT AND MOUTH DISEASE

Mr C. M. Higgins, of drawing ink fame, of Brooklyn, N.Y., some years ago wrote a book entitled *Horrors of Vaccination* in which he drew attention to the fact that official publications of the United States Government ascribed several epidemics of foot and mouth disease in this country directly to the use of vaccines or serums; especially those of 1902, 1908, and 1915.

The Chief of the Bureau of Animal Industry of the US. Department of Agriculture says in his report for 1902 (page 394):

"Most veterinary text books state that foot and mouth disease is a mild infection and that only 1 or 2% of the animals attacked die from it, the reader being left to infer that the losses do not exceed 2 or 3% of the value of the animals. Such a conclusion would be a grave mistake."

However, it seems to have been mild before its cause was traced to vaccines. The Secretary of Agriculture says in the department Year Book for 1914, page 20:

"There were outbreaks of foot and mouth disease in this country in 1870, 1880, 1884, 1902, and 1908. Since the close of the fiscal year 1914, the sixth outbreak has occurred. The first three, those of 1870, 1880 and 1884 were comparatively trifling. Those in 1902 and 1908 were more grave. The present one is the most serious and extensive of all.

"In 1902 the outbreaks occurred in the New England States. In 1908 it originated in Detroit. The origin of each of these new outbreaks was traced to the importation of vaccine virus for the propagation of vaccine for use in vaccinating people against smallpox. The vaccine was imported from Japan where the foot and mouth disease exists. Each of these outbreaks was stamped out by methods which have proved most effective in preventing the disease from gaining a footing. These methods involved the killing of all infected and exposed animals, the burying of the carcasses, and the thorough disinfection of all premises with which the animals may have come in contact."

The first part of the 1914 outbreak was ascribed to "an imported article used in tanning" (hides?) but when this was stamped out, a recurrence occurred near Chicago, in August 1915, that was traced to a Chicago laboratory making hog cholera vaccines. Foot and mouth disease was found in 8 of 11 herds that had used this vaccine.

The Secretary of Agriculture says of this in the 1915 Year Book (p.27):

"It seems certain that this infection was produced by contaminated hog cholera serum prepared in Chicago, in October 1914, at an establishment where the disease had not been known to exist at any time...pending investigation, all shipments of serum from Chicago were prohibited. It was found that some of the product of the establishment had been used on 11 herds of hogs...a few infected hogs were found in eight of the herds and all 11 herds were slaughtered at once."

Although they had found the disease in 8 herds on which the vaccine had been used, they decided to 'test' the serum, and what a test!

They knew, or were very sure, that the vaccine had given the hogs the foot and mouth disease, yet the first four tests on a total of 52 animals were all negative, but they had plenty of perseverance, and in the fifth 'test' and on the 62nd animal tested, they found foot and mouth disease!

If it took 'tests' on 62 animals to obtain proof that a vaccine that had already caused the disease could do so again, how can anyone know that it would not take two or three or more times 62 'tests' any other time, assuming, of course, that these are tests, which, again, I don't believe!

And after such a failure, how can any doctor or veterinarian consider any tests, such as the Schick, Dick, Tuberculin, Wasserman, etc., of any value whatsoever?

With all the evidence we have given that germs can change their characteristics, from Miss Nightingale and Professor Bechamp, to Lohnis, Rosenow and others, how can anyone expect a germ to remain constant through any 'test' or remain true to its original characteristics after being 'tested'?

The Secretary of Agriculture says of these so-called 'tests' on the same page:

"This is regarded as proof that the suspected serum actually was infected. Why the standard test used on 61 of the animals failed to reveal this fact is a matter for scientific investigation, and the bacteriologists of the department are at work on the problem. At the time of manufacture 0.5 of 1% of carbolic acid was mixed with the serum as a preservative. It is now believed that the acid, acting as a germicide, may have attenuated or partially destroyed the virus so that tests previously considered safe failed to establish the presence of the infection."

If they had no better luck than Pasteur had with his anthrax tests, it will be a long time before they find out very much!

As the average serum is only some toxic decomposing proteins, and some germs that are really re-workers of dead tissues or waste, but which the doctors believe to be the cause of the dead tissues they are found with, the germs are very apt to change their characteristics as the toxins break up, just as they have repeatedly

been shown to do elsewhere in nature.

Consequently, many serums would not remain constant through 61 tests, nor would anyone who sells serums to the public be likely to make 62 tests before telling their customers that it was pure serum!

Even after it is 'tested' it may change in storage, and how do they know when they have the right germ in the serum anyway, as the best authorities admit that some germs, such as the smallpox germ, have not been isolated?

The Secretary of Agriculture says (of the hoof and mouth disease) on page 29 of the same volume:

"Up to the present time the germ has not been identified, although the scientists of Europe have studied the disease exhaustively for years."

They killed 168,158 animals valued at about \$5,676,000 to suppress the 1914-15 epidemic.

Circular No. 325 of the Agricultural Department says:

"Immunization in the 1914 outbreak was out of the question, as the only serum thus far produced gives but a passing immunity of only a few weeks duration, unstable at best."

Mr Higgins pointed out that the disease is more prevalent in countries that have compulsory vaccination than in others.

The U.S. Dept. of Agriculture quotes Dr Loeffler, head of the department handling the trouble in Germany, as saying before the 7th International Congress of Veterinary Surgeons at Baden Baden in 1899:

"Foot and mouth disease is spreading more and more every year and every year it costs the German Empire enormous sums. Necessary measures have been taken with the greatest care; suspected grounds have been closely quarantined; this measure had been extended to whole communities and even to entire districts; disinfection had been carefully carried out; and notwithstanding all this, the disease kept spreading."

The Foot and Mouth Disease Commission of the U.S. Department of Agriculture

published a chart⁷³ showing the trend of foot and mouth disease in Germany from 1886 to 1924, which is reproduced on the opposite page.

Note the tremendous increase in deaths that accompanied the first general use of serums in 1920!

The U.S. Department's Farmers Bulletin No. 666 says:

"Foot and mouth disease has prevailed in Europe for a great many years and has occasioned tremendous economic losses there.

In Italy, France, Switzerland, Germany and Russia the plague has existed so long and has gained such a foothold that it is economically impossible to fight it with the American methods of slaughter and disinfection."

In Germany in 1911, 3,366,369 cattle, 1,602,927 sheep, 2,555,371 hogs and 53,674 goats were affected, or 7,578,371 animals of a total number of about 51,319,000 farm animals in the country at that time. As the chart indicates that about 247,000 farms were affected that year, this would give about 30.6 animals per farm. If the 1920 figures of 746,571 farms affected averaged the same, it would run to nearly 23,000,000 animals, close to half the number of animals in Germany! They used serums this year also, which probably helped spread it.

The same bulletin quotes one scientist as saying:

"...that unless all the affected farms were absolutely isolated and the movement not only of live stock but of persons absolutely prohibited, the disease could not be stamped out. Such a quarantine is of course utterly impossible to enforce."

Italy, France, Germany and Switzerland have compulsory vaccination, hence large vaccine plants that can spread the disease, as occurred in the cases cited in the United States.

And of course neighbouring states with or without compulsory vaccination would be overrun by importation from these countries, though some, such as England, kept it out pretty well.

Other places where vaccination is pushed, such as Brazil in South America, also have the disease, while Canada, the United States, Mexico, Australia and New

Zealand, all of which are comparatively free from intensive vaccination drives, also seem to have only sporadic attacks of foot and mouth disease, which are generally easily stamped out.

How can the 'scientists' account for this?

RABIES OR HYDROPHOBIA

According to Farmers Bulletin No. 449 of the U.S. Agricultural Department, no one can catch rabies from an animal that bites them unless the animal has the disease. Furthermore, less than 15% of those bitten by a rabid dog and not treated will generally contract the disease. This is very different from the hullabaloo generally raised by the self-styled 'regular' doctors, and especially by health officers, over every dog bite they hear of. In an official publication such as the Farmers' Bulletin, this is quite an admission; unofficial and anti-vivisection sources of information generally place the percentage much closer to zero.

Bulletin No. 65 of the U.S. Hygienic Laboratory at Washington also admits that those who die after treatment die earlier than untreated cases! It says:

"Treatment. Nitsch has pointed out that in a large series of cases the deaths in spite of the Pasteur treatment occurred on average earlier than in untreated persons (64.5 to 90 days).

There is some reason to believe that the rabies virus as it occurs in nature varies much in virulence, and that this is in some way related to the geographic distribution." (p.21)

To anyone who read Chapter 7 it will be evident that (assuming it has value), one should not use a serum from a distant location if this is true, as the possibility of 'agglutination' would be very small where there were such variations. And to this they add:

"Inoculation with spinal fluid obtained during life is wholly unreliable as it usually fails even in true cases of rabies." (p.36)

The New York Anti-Vivisection Society has published several pamphlets from which the following information is taken.

They state that rabies is a very rare disease except where dogs have been injected with rabies serum, in which case it very often develops.

According to their views, a dog unable to find green grass to eat in winter is very apt to develop worms or maggots, or both, in the intestines, often perforating them, and driving the dog frantic. In this condition the dog will bite at everything blindly, foam at the mouth, and run amuck generally, refusing water and seeking solitude.

Hay, grass, hide or bones fed to the dogs will cause the irritable conditions to disappear.

There are no real grounds for supposing that madness, as found in humans, occurs in dogs, nor can it be proved that the bite from a distracted animal can produce madness in anyone bitten. Further, so-called rabies can be shown to be the direct result of serum injections.

Competent authorities claim that in so-called 'real' rabies, a dog never foams at the mouth, but has a small amount of brownish stringy discharge hanging from the lips, and the eyes have a fiery glare.

In epilepsy, the dog trembles, his jaws champ violently and his voluntary muscles are powerfully convulsed; there is a copious discharge of white frothy saliva; he utters sharp cries and when recovering from the fit, the eyes are dull and stupid. This might be due to fright, or heat in summer.

They quote doctors of unquestionable authority as saying that no rabic germ has been found; and that finding so-called Negri bodies is no proof that the dog has rabies; as "they are found when all symptoms are absent and when all are present, so the diagnosis of rabies is pure guesswork", according to J.A. McLaughlin, D.V.S.

Even by A.M.A. standards no successful serum can be made without the right germ, so this might account for the large number of deaths that follow the Pasteur treatment.

Some doctors say the bite of a rabid dog is absolutely harmless to man. C. W. Dulles, M.D., a famous authority on dog diseases and hydrophobia who looked up the records in many cities, says over a million dogs and cats were handled by dog catchers in 14 years, with many thousands of bites, but no treatment—and not a single case of hydrophobia appeared in these cases.

He and other doctors had posted for years standing offers of \$100.00 to \$1,000.00 for a genuine case of dog hydrophobia and had no claimants, though thousands of dogs were being killed yearly because of scares; one place claiming that 92% of those killed in one year had hydrophobia!

These doctors say chaining or muzzling a dog that has always been free is apt to cause the very irritability we want to avoid.

PASTEUR'S TREATMENT CAUSES RABIES

In man, they say the death rate in France in cases of so-called rabies is 19 per 100—the highest in the civilized world—and the same as before the Pasteur Institute was established, and cases of hydrophobia have enormously increased, while just across the Rhine in Germany, hydrophobia is almost unknown.

The year before Pasteur started his treatments there were four deaths from hydrophobia in Paris, the year after there were 22! Not only France as a whole, but each department of France, and in fact every country that has allowed the Pasteur 'treatment' to be introduced, have all shown a sharp increase in the number of deaths from hydrophobia after such introduction!

In England there were several Pasteur Institutes doing a thriving business prior to 1902, when a commission was appointed to investigate rabies and the serum treatment, and the Institutes were abolished. They have had no hydrophobia since.

They claim that over 3,000 people died in England before 1902 after being bitten by dogs and then taking the Pasteur treatment, while more recently the London Hospital treated 2,668 persons bitten by dogs without using the Pasteur treatment, and none of them developed hydrophobia!

While these are not complete figures for England, there are nearly 6,000 cases of dog bite treated in institutions; and of these only those who had taken the Pasteur treatment died. Why not try something different?

And there has never been a case of hydrophobia in Norway, Sweden, Iceland, Denmark, Holland, Belgium, New Zealand and Australia, because those countries will not tolerate a Pasteur Institute within their borders.

They say the Pasteur treatment is very often the cause of rabies, is always dangerous, sometimes even murderous, and is never beneficial.

J. W. Dodson, M.D., of Brockport, N.Y., wrote years ago:

"If people would only think for themselves and not blindly follow the agitator or grafter we would soon be relieved of this pest, rabies."

For a safe, sane and logical treatment that has saved patients with rabies for over 100 years, we would recommend the Buisson Bath, a hot vapor or steam bath that is fully described in *Drugless Cures* by this author.

THE TUBERCULIN TEST

As the so-called tuberculin test has been rather fully discussed in the pamphlet *The Tuberculin Test a Fraud*, and in Chapter 7 of this volume, it seems hardly necessary to say more on this subject here.

Needless to say, it is as big a fraud as a 'test' on animals as it was as a 'cure' for humans, and there is a great deal of substantial evidence that the testing vaccine (or its needle) causes tuberculosis in cows and other animals, as it did in the human subjects used in Koch's experiments.

It should be absolutely forbidden, and those who use it should be barred from practice.

CHAPTER 9

REAL IMMUNITY

Many years ago the famous English physician Alexander Haig proved in "Uric Acid in the Causation of Disease" that the breakdown of human cell tissues was due primarily to uric acid formed in the breakdown of protein, and that all animal flesh contained some uric acid when eaten, hence was much more potent in starting this breakdown than plant foods, which were all free of uric acid when fresh. He contended that germs were merely of secondary importance, and never the cause of the various conditions of ill-health with which they were frequently found.

Surprising confirmation of his ideas seems to come from some experiments conducted by F. M. Pottenger, M.D., and D. G. Simonsen on cats.

They put two groups of cats on diets of meat and vegetables, identical except that in one group the meat was given raw, and this group seemed to maintain normal good health throughout the experiments. In the other group the meat was all cooked, and this group showed an astonishing breakdown of health in all the animals.

They found every sign of lack of minerals, such as incomplete development of the skull or other bones, bowed legs, rickets, curvature of the spine, paralysis of the legs, convulsive seizure, thyroid abscesses, cyanosis of liver and kidneys, enlarged colon, and degeneration of the motor nerve ganglion cells throughout the spinal cord and brain stem, with some cells affected in the cerebellum and cerebral cortex.

Strange to say none of the cats on raw meat had any of these troubles at all, yet millions of humans are afflicted with one or more of them, and have no conception of the cause, and neither have their doctors in most of the cases.

They add, of these cats:

"The deficiency renders the experimental animals so deplete in important vitalizing factors that the third generation is unable to live beyond the period

corresponding to childhood in the human being."

Why did only those cats fed cooked meat have all these troubles?

We must remember that all protein contains nitrogen and sulphur, which when released in the body combines with water and other matters to form destructive uric acid and sulphurous or sulphuric acids, all of which must immediately be neutralized by the alkaline minerals to prevent cell destruction. If no minerals are instantly available, they will destroy living tissue to get them. This in turn will release more nitrogen and sulphur to continue the process ad infinitum.

Furthermore, all forms of animal flesh contain proteins and acids which are broken down during the process of digestion, and these experiments prove conclusively that cooking meat breaks down a great deal more protein, causing the formation of more of these acids, which clearly were what wrecked the cats' lives. If humans want to avoid the same or equivalent results, they must give up cooked meat, and I believe should give up all meat, for the rest of their lives.

These acids break down body tissues, and germs arise merely as scavengers; if we can stop the breakdown of tissue through a diet free from these acids, we can also end the danger from germs, as well as the troubles from decalcification and eliminating meat. Reducing the total protein eaten would accomplish this in a large measure.

Dr M. Hindbede, famous Danish dietician, says a 150 lb. man can live on half an oz. of protein a day, and be healthier than a person eating a greater amount; and he adds it should be vegetable protein.

In biblical times, people ate fruit and nuts and had good health to ages beyond 900 years, but in Noah's flood, fruits and nuts were so depleted that man has eaten meat, raw and cooked, ever since and suffered and died like these cats.

Dr J. Bitner, of Yakama, Washington, has cured intestinal infections in young children by withholding all milk and protein from the patient for two days, and giving a quantity of apple pulp, which has considerable antiseptic effect. He cured about 90% of his cases with this two-day treatment, although he had many relapses among the 10% when they were allowed milk and protein.

This, I believe, was due to the short treatment not completely eliminating all of

the waste protein in the system. Four, six or eight days or even longer periods without milk or protein in the more severe cases have better results.

However, he only had one death in 946 cases, a far better record than the average physician usually has in such troubles. See my book *Prolongation of Life Through Diet*, pp.77-82.

There are many authorities who maintain that a well mineralized system such as we would have on a vegetarian or fruitarian diet would be absolutely immune to germ action of every kind.

Dr J. Greer says in *The Physician in the House* and also in *The Drugless Road to Perfect Health* that in cases of diphtheria, if the patient gargles the throat with lemon juice every hour, it will cut the false membrane loose so that it will come out.

Possibly more frequent gargling would be better, and an exclusive fruit juice diet for a few days would quickly restore normal health.

"A very high percentage of all physical disturbances in the tropics are intestinal—some wrong food, some wrong drink, a few germs.

All in all the chief danger is with what is eaten and what is drunk; and the thing is so simple, unless you are a glutton, that it seems absurd that everybody traveling along the equator should not be fit all the way."

In an article entitled *Lemon Squashing 'round the World* in the *Saturday Evening Post* of July 24, 1926, (p.68), Samuel Blythe advises all visitors not acclimatized to tropical countries to entirely avoid meat and liquor, to reduce to a minimum the amount of proteins and starches eaten, and to subsist principally on fruits and vegetables. He adds:

"Lemon squash is the panacea for tender feet in the tropics. It is the regulator, the reviver, the protector against fever, the assassin of germs, the foe of tropical acidity, the enemy of rheumatic conditions, the quencher of thirst, the general efficient hygienic handyman within the body.

There is no doubt that the two most beneficial fruits known to man are the orange and the lemon, and it is in the tropics that the lemon shines with the greatest effulgence.

It is a hygienic policeman that polices the body, paying strict attention to the liver, supplies richly the needed mineral salts, and when burned in the process of digestion leaves an alkaline ash that neutralizes the acids that are so copiously the result of tropical living conditions. The lemon is a friend, aid and companion, and the way to utilize it is in squash."

He goes on to say that lemon squash is a lemonade as we know it, made from fresh lemons, while bottled lemonade in the tropics is a citric acid preparation usually artificial in composition, and should be avoided. He also advises no sugar or very little, and to see that the squash is made from the fresh fruit and good water. He adds:

"Get it and drink it by the quart. Drink 5 or 6 or 7 or 10 lemon squashes a day. Drink one every time you feel thirsty, but always between meals, never at meals...lap them up. They are cool, they are refreshing, they taste good, and they surely are life preservers... you will be better off without tea and coffee.

"Literally I lemon-squashed my way around the world. Not a day passed when I was in the tropics that I did not drink 8 or 10 of them, and in the cooler climates I took 2 or 3. I drank them straight without sugar...fruit and sugar do not make a good food or drink combination.

"The result was marvellous. The lemon squashes kept all bodily functions regular, kept me in perfect health, and I am quite a way past my 50th birthday. I did not have an ache, a pain a digestive disturbance, a physical qualm of any sort...and was perfectly fit and perfectly well all the way. Just a little care about food and the assiduous consumption of lemon squash did it."

The same drink—lemonade—as well as others, such as pineapple juice, grapefruit, oranges, and the cold pressed juices of the green leafy vegetables, and beets, carrots, tomatoes, etc., are all rich in the minerals needed to control acidity.

And we can use smaller quantities of them if we avoid meats and liquors and hold the quantity of acid forming proteins and starches to the minimum needs of the body.

A correct diet will control any infection as well as most other forms of ill health.

CHAPTER 1

THE FALLACY OF VACCINATION

THE FALLACY OF VACCINATION

John Pitcairn

President of the Anti-Vaccination League of America

1911

Restored and updated by

Trung Nguyen

Edmonton, Alberta, Canada

2018

THE FALLACY OF VACCINATION

“Our legislators should be told at every possible opportunity that, by permitting the Vaccination laws to continue on the statute books, they are responsible for the deterioration of the race, for untold agony, physical and mental, and for the countless legalized though officially concealed murders. We are far too mealy mouthed about this matter. Plain speaking is needed to battle with the prejudices of officialdom and the vested interests of the medical profession. ‘Lymph’ is a false term. It is diseased and disease bearing matter, and should be called pus, and its wilful insertion into the skin of any human being should be called blood poisoning, and denounced as a crime of the first magnitude. Thus only we can bring home to the average legislator his responsibility for the terrible consequences of his ignorance and his submission to a prejudiced and interested profession.”—Alfred Russell Wallace, OM (Order of Merit) FRS (Fellow of Royal Society), 1911

JOHN PITCAIRN

The Anti-Vaccination League of America

Born in Scotland, January 10, 1841

Died at Bryn Athyn, Pennsylvania, July 22, 1916

Vaccination is the putting of an impure thing into the blood—a virus or poison—often resulting in serious evil effects. In vogue for more than one hundred years, it has been received by most persons without question. Yet the time is passing when people will accept a medical dogma on blind faith; they now demand to know something about the practices to which they are called on to submit. And most insistent of all should be the demand to know something of a practice which, like vaccination, involves the risk of disease and of possible death.

THE DANGERS OF VACCINATION

That vaccination has such risks is conceded even by its most zealous advocates. In Philadelphia and vicinity there were in the autumn of 1901 no fewer than 36 cases of tetanus, or lockjaw, which were admitted to have resulted from vaccination, and nearly all were fatal. After a study of these and 59 similar cases a prominent Philadelphia physician and professor, himself an ardent believer in vaccination, arrived at the conclusion that neither careless dressing of the wound nor infection from a foreign source could account for the cases of lockjaw following vaccination; for, as he pointed out, cases had occurred not only among the ignorant and filthy, but also and equally among those who lived under the most favourable conditions, and even where the utmost precautions had been taken. He concluded, therefore, that the danger lay in the virus itself. Then, ignoring the fact that this virus is nothing but the matter running from diseased sores, he recommended greater care in its preparation. (1)

During the same year—1901—Cleveland, Ohio, was suffering from a severe epidemic of smallpox. Vaccination was carried on all over the city; and with what results? In one household three children whose vaccination had been pronounced "highly successful" broke out with a profuse eruption of smallpox nineteen days after the operation. In many instances arms swelled down to the elbow and wrist, with enlargement of the glands in the armpits, and the patients were thrown into a high fever. It was not unusual to find pieces of flesh as big as a dollar and twice as thick dropping out of the vaccination sores, leaving ugly, suppurating wounds which took from six weeks to three months to heal. The health officer of the city was appalled at the sights that met his eyes, and, despite his ardent belief in vaccination, after witnessing, to use his own words, "the tears and cries and pains and misery" of the people, he declared that "the man who can stand all that is no man." A sigh of relief went over the city when he stopped vaccination. (2)

Turning to England and Wales we find that from 1881 to 1907, inclusive, the Registrar General reported 1,108 deaths from vaccination, the deaths averaging one every week during the first sixteen years. (3) And, remember, these 1,108 deaths are all admitted by vaccinists themselves to have been due to vaccination. The reports take no account of that greater number of deaths from vaccination that were ascribed to other causes. In regard to this, Professor Alfred England and Wales alone vaccination is the probable cause of 10,000 deaths every year—

deaths by five diseases of the most terrible and disgusting character, introduced by the vaccine virus. (4)

VACCINATION AND COMPULSION

But I need hardly appeal to statistics, which might be gathered from every civilized country. Consult any mother having practical acquaintance with the results of vaccination as observed by herself and you will rarely fail to hear something of its serious and lasting ill-effects.

Surely these facts and figures are enough to show that vaccination involves serious risks, and to make it incumbent upon all, and especially on parents, to make some inquiry at least before they submit either themselves or their children to these risks.

But, someone may ask, if all this is true why does vaccination continue? It continues, very largely, because it is enforced by law. But it has been enforced almost from its birth and has thus come to be regarded as more or less a matter of course. In all modern history no other medical operation has ever been legally enforced. But vaccination needed enforcement. Without compulsion it could never have survived; for from the very day of its introduction it has been strenuously opposed both by laymen and by members of the medical profession. Eminent physicians, it is true, have supported it; but equally eminent physicians and also renowned bacteriologists and statisticians have condemned it as productive of the gravest injuries.

What is vaccination? It is easier to ask this question than to get a satisfactory answer. Put the question to a number of doctors and observe the conflicting replies. Not all would agree with Webster's definition, that it is inoculation with cowpox, (5) for the modern American school now holds that it is inoculation with smallpox modified from the cow! (6)

And then: What is vaccine virus? Of course it comes from the cow; but where did it originate? And what is its effect when put into the human blood? Ask such questions and you will see the confusion that reigns. Vaccination today is not what it was yesterday, and still less what it was in Jenner's day. Indeed, one of the most conspicuous features of the practice has been its constant shiftiness.

And so I propose to answer the question, "What is vaccination?" by a brief survey of its history, showing what it has been as well as what it now is.

CHAPTER 2

THE HISTORY OF VACCINATION

The direct progenitor of vaccination was smallpox inoculation—the insertion into the blood of a healthy person of the running matter from the sore of a smallpox patient. This practice was introduced into England, in 1721, by Lady Mary Wortley Montagu, wife of the British Ambassador at Constantinople. Writing from that city Lady Montagu said that the smallpox was rendered entirely harmless there by the invention of what the Turks called “ingrafting” and that there was a set or old women who made it their business to perform the operation. (7)

This practice of "a set of old women" in Turkey was adopted in England, where it was soon regarded as the greatest of medical discoveries, and its influence in checking smallpox was spoken of as "one of the best established of medical facts." (8) Indeed the praises lavished upon inoculation by the medical profession of that day have been equaled only by those since accorded to the ever changing forms of vaccination. In 1754 the Royal College of Physicians, of London, in a formal resolution declared that the arguments which had been urged against smallpox inoculation had been refuted by experience, and that the College thought the practice to be "highly salutary to the human race." (9)

But the facts could not long be ignored. Instead of proving itself a harmless and beneficent invention, experience made it evident that the practice of smallpox inoculation actually and naturally enough spread smallpox—every inoculated person becoming a new centre of contagion. This fact so strongly impressed itself on the British public that in 1840 the inoculation which had been so highly endorsed by the Royal College of Physicians was condemned by Act of Parliament as a criminal offense. (10)

But previous to this time a new "scientific" protection against smallpox had been discovered. This discovery, as is well known, was given to the world in 1798, by Edward Jenner, (11) popularly called the Father of Vaccination. It is not so well known, however, that the vaccination advocated by Jenner, like smallpox inoculation, has long since been repudiated by the medical profession. Jenner's first experiment was with swinepox, with which he inoculated one of his own

children. (12) He then adopted the belief of the country people that one who had had cowpox could never take smallpox. (13)

With this in mind he performed his first vaccination in 1796, using a virus taken from the sore of a milkmaid infected with cowpox. (14) Not satisfied with this he next turned to horsegrease, as he called it though it afterward appeared that he was really dealing, not with horse grease, but with horsepox—using virus taken from the sore of a man who had been handling the heels of a sick mare. (15) These experiments led Jenner to his final "great discovery." This was neither cowpox nor horsegrease, but a combination of both. (16)

The cow, infected with horsegrease, was in its turn to give this horsegrease cowpox to a human being. From the sores of a human being the virus was then to be taken which Jenner claimed would make a person "forever after secure from the infection of the smallpox." (17)

Four years later, in a petition to the House of Common, he stated that his new species of inoculation "must finally annihilate that dreadful disorder." (18) The claims which had been made for the old inoculation were now transferred to vaccination. It was vaccination with horse grease cowpox which now became "one of the best established of medical facts" and "highly salutary to the human race." (19) But pernicious results followed vaccination just as they had followed inoculation. Simple observation showed that vaccination did not confer immunity for life. And not only this, but smallpox continued to spread. Then came the cry that vaccination must be repeated; a first vaccination in infancy and a second in youth; and this soon became the established doctrine. (20) But still the vaccinated suffered from smallpox. Then followed other changes, until at last Jennerian vaccination was abandoned in all save the name. (21)

ARM-TO-ARM VACCINATION

First came what was called "arm-to-arm vaccination." This consisted of inoculation with pus from the sore of a vaccinated person. Then it was arm-to-arm vaccination that became "one of the best established of medical facts" and "highly salutary to the human race." But, alas, for this improvement! Its continued practice brought the discovery that scrofula, tuberculosis, and even worse diseases latent in the constitution of the subject from whom the vaccine

virus was taken, were being sown among the people. (22)

The growing doubt and agitation in the public mind finally led in England to the appointment of a Royal Commission—to investigate the subject. This Commission, of which Lord Herschell was chairman, was in session for seven years—from 1889 to 1896—and received the testimony of experts from all parts of the civilized world. Its report is comprised in fourteen folio volumes and constitutes the most exhaustive collection of medical evidence ever taken. (23)

Though out of the sixteen members of the Commission only three were anti-vaccinists yet the result of its investigation was the passage by Parliament of the "Conscience Clause" of the Vaccination Acts. This clause, passed in 1898, exempted from vaccination the children of parents who declared a conscientious objection to the practice. England, the birthplace of vaccination, after a century of experience of its disastrous effects, thus freed her people from its enforcement. (24)

The testimony taken before the Commission not only caused the enactment of the Conscience Clause; it proved also the death blow of arm-to-arm vaccination. The horse grease cowpox of Jenner had already been discarded. Arm-to-arm vaccination, in its turn, was now discarded. Both were condemned as thoroughly as they had previously been endorsed. Now it was held that vaccine must be derived from spontaneous cowpox without infection from horse grease, and that the matter from the running sores on a calf thus diseased furnished the only sure protection against smallpox. (25) The pus from horse grease, Jenner's "true and genuine life preserving fluid," was entirely lost sight of.

The new theory was only acclaimed; the true method of protection had at last been found. And again we have the "best established of medical facts," so "highly salutary to the human race." Even this, in its turn, is now condemned and discarded. Cowpox itself has fallen into disrepute, and at the present time we have a return to the old system of smallpox inoculation which Jenner specifically denounced; for the vaccine now used consists of pus taken from the sores of human smallpox and supposed to be modified by inoculation through a series of calves. (24)

Without notice to the public the word "vaccination" has been used in medical literature to mean totally different things at different times? When Jenner used it he meant cowpox, not smallpox, matter. Now it is used to mean smallpox, not

cowpox matter. And it is still called Jennerian vaccination! Can inconsistency go further?

THE ALLEGED IMMUNITY OF VACCINATION

But the inconsistency is not confined to the matter of the vaccine virus. It is equally glaring in the claims as to immunity. At first one vaccination was to protect for life; (28) this claim was soon modified and two vaccinations were considered necessary to confer lifelong immunity. (20)

The obstinacy of smallpox in attacking persons so vaccinated then resulted in shortening the period of immunity to fourteen years; (30) afterward it was reduced to seven years, (31) then five, (32) and, in the Spanish-American War, as shown by the practice of our army surgeons, six weeks was considered the limit of immunity. (33)

What could better prove that vaccination never has provided immunity? For if six weeks is now the limit of immunity, then it was likewise the limit when Jenner and the College of Physicians so confidently proclaimed immunity for life. But vaccination does not provide immunity even for six weeks. This is proved by the statistics of our Philippine Army. During the five years from 1898 to 1902 there were in that army 737 cases of smallpox, with 261 deaths—a mortality of over 35%! (34) And yet, referring to these very cases, Chief Surgeon Lippincott reported that "vaccinations and revaccinations many times repeated, went on as systematically as the drills at a well regulated post."

He added, "I believe I can say that no army was ever so carefully looked after in the matter of vaccination as ours, and that the department commander, General Otis, fully alive to the necessity, did everything in his power to make our work possible and effective." (35) But the soldiers still took smallpox and died of it. Where, then, is the immunity even for six weeks? But we need not go to the army for our illustrations; ask anyone who has suffered from smallpox whether he has been vaccinated, and the answer generally will be, "Yes." Where, then, is the triumph of vaccination? Where the "scientific" protection against smallpox? Science is preeminently consistent but the only note of consistency we can discern in vaccination is that each change has invariably been proclaimed as the infallible protection and the "best established of medical facts."

MANY FORMER VACCINISTS HAVE REPUDIATED IT

In view of the steadily receding character of the immunity claims made for vaccination, what; then, are the arguments by which it is still defended? First, appeal is made to an asserted unanimity of opinion in the medical profession. The statement will hardly be denied, however, that few physicians have made any original study of the subject. Vaccination is taught in the medical schools as a fact established beyond question, and it is the tendency of the human mind to accept as proved that which is established. Yet long usage proves nothing; instance the practice of blood letting, followed for centuries. Moreover, not one of the many varieties of vaccination has even been well established are it has been displaced by its "infallible" successor.

There are many remarkable examples of medical men, who, formerly accepting vaccination as a matter of course, have been led by investigation to repudiate it entirely. Such a man was Doctor W. J. Collins, a public vaccinator of London, who, in 25 years vaccinated many thousands of persons. Study and his own experience finally led him to the conclusion that vaccination had never diminished smallpox, but on the contrary, had often produced it. He expressed the conviction that cowpox inoculation, whether performed with matter originating in the greasy heels of the consumptive horse or in the running sores of human smallpox, is a practice dangerous to the community at large; and he was so convinced of this that he abandoned vaccination altogether, thereby giving up an income of at least \$2,500 a year. (36)

Among the distinguished physicians whose names come to mind in this connection are the eminent pathologist, Doctor Charles Creighton, and the equally eminent bacteriologist Professor Edgar M. Crookshank. For the purpose of writing the article on vaccination for the Ninth Edition of the Encyclopedia Britannica, Doctor Creighton made an original and exhaustive inquiry into the subject. The conviction soon forced itself upon him that vaccination is both useless and dangerous. Despite his changed views, however, the compilers of the Encyclopedia still desired him to write the article giving his honest and unbiased conclusions. The result may be read by anyone—fifteen columns, in which reason and science, experience and statistics, combine to prove the utter fallacy

of vaccination. It should be noted, in passing, that Doctor Creighton's article, signed "C. C.," is not to be found in some of the American reprints of the Britannica.

About the time Doctor Creighton's article was published, Professor Crookshank was engaged in investigating the diseases transmissible from the lower animals to man, and the question naturally arose whether his observations would support or refute Doctor Creighton's conclusions. Professor Crookshank, who favoured vaccination, went into an original and exhaustive examination of the subject, and the result was two volumes against vaccination. (33)

CHAPTER 3

THE IMMUNITY THEORY, A PURE HYPOTHESES

The immunity theory by which vaccination is supported is a pure hypothesis. Without technical details the theory is that the introduction of vaccine virus into the human blood produces such a change therein, by the increase of certain of its corpuscles, that there is created an antagonism to the supposed smallpox germ or bacillus. The theory may be popularly illustrated by the practice among the Borgias of taking poison in small doses, gradually increased, in order to secure immunity from similar poison; or by the opium or morphine habit—persons who indulge in this habit becoming in time immune to doses that would kill the average man. At first blush this sounds quite plausible, but the great trouble with the argument is that those who are thus rendered "immune" by vaccination do take smallpox and also die of it. Even the vaccinists admit that the vaccinated take smallpox—but the admission is made with qualifications. If the person dies of smallpox, then the vaccination was not successful; if the case is only a mild one, then it was only partially successful!

In one of the leading scientific works on this subject, written by two prominent vaccinists of Philadelphia, the statement is made and made seriously—that in a certain case where a vaccinated person had taken smallpox, a proof that the vaccination was "spurious" was its "signal failure to protect against smallpox." (39) But even supposing the possibility that by vaccination many times repeated one may eventually become immune—that is, provided he does not die from the process, who would envy him the condition of his blood? He is "immune" by virtue of blood poisoning; for vaccination if it "takes" means nothing less than blood poisoning. And with poisoned blood, in what condition is the system to resist the ailments to which mankind is liable? The case is well illustrated by the morphine or opium habit. It is true that one addicted to this habit becomes in time immune to the effects of morphine or opium, but who envies him his immunity?

STATISTICAL ARGUMENTS BROUGHT FORTH

Pages might be filled with an analysis of the statistics brought forward to uphold vaccination, but space will permit the notice of only two or three. In general the argument from experience claims that since the introduction of vaccination smallpox has remarkably decreased. This statement is true, but the suggestion that the decrease is due to vaccination is a mere assumption. It would be nearer the truth to say that the decrease is due to public sanitation, the betterment of living conditions and the enforcement of isolation. This is especially evident in the German Empire, where sanitary and quarantine measures are so strictly enforced. (40)

Again, in Cuba, Panama and New Orleans, for example, the scourge of yellow fever has been exterminated solely by hygienic measures and the prevention of mosquito inoculation. The benefits of sanitation and quarantine have been freely admitted in the cases of all contagious diseases except smallpox. But where smallpox is concerned there is a curious change of front. Everything is due to vaccination! In yellow fever the vaccinist will wage relentless war to stamp out the mosquito inoculator, but in smallpox the war is waged against those who would stamp out the human inoculator.

In addition to the claim that vaccination has decreased smallpox, hospital statistics are cited to show that the mortality of smallpox among the vaccinated is never more than 17 or 18%, while that of the unvaccinated runs to over 60% (41) It may be noted that the necessity to prove a low mortality among the vaccinated has led, perhaps unconsciously, to forgetfulness of the claim that vaccination is certain protection against smallpox. But we pass this by to note something even more remarkable. Under the filthy conditions prevailing before vaccination was even heard of, the average smallpox mortality was less than 17%. (42) And now the mortality among the Vaccinated is said to be as high as 60%. If true, this would show not that vaccination protects, but that an opposition to vaccination carries with it an increased liability to smallpox. In other words, if you now refuse to be vaccinated, then, in spite of all modern science, sanitation and hygiene, you will be many more times liable to smallpox than if you had never heard of vaccination.

Statistics that lead to so ridiculous a conclusion are—well, suspicious. And the suspicion is strengthened when we consider that the hospitals receive many smallpox patients in the advanced stages of the disease, when it is necessarily difficult, and even impossible, to determine the question of vaccination. (43)

Japan is a favorite example of the blessings of vaccination. In Japan, under the law of 1872, strengthened in 1885, vaccination is compulsory during the first six months of life, again at six years, still again at fourteen, and after this whenever smallpox occurs. For all males there is still further vaccination on entry to the army and navy. (44) The law is strictly enforced and complied with. There being, as recently stated by Surgeon General Takaki, no anti-vaccinists in Japan. (45) Of this paradise of vaccination it is said: "smallpox, once the scourge of the island, is now all but unknown. (46)

I have before me the official statistics of the Sanitary Bureau of Tokyo, from 1889 to 1908. During these years there were in Japan 171,500 cases of smallpox, an average of over 8,500 a year, with 48,000 deaths—a mortality of 28%. And in 1908, when the Empire should have been reaping the best fruits of its rigorous vaccination laws, the smallpox cases numbered 18,000—a number not exceeded since 1897—and the deaths were nearly 6,000, or over 32%. Eighteen thousand cases, and "smallpox almost unknown"! (47)

WHAT IS VACCINE VIRUS?

The fatalities from vaccination are frequently ascribed to "impure virus," and physicians are cautioned to see that their virus is "pure." As if there were such a thing as pure vaccine virus! Disguise it as you may, vaccine virus is simply the putrid matter ruining from the sore of a diseased calf. Further than this no physician, nor even manufacturer, knows what it is.

The physician who buys from the drug store has no assurance of the harmlessness of his Purchase. This was strikingly illustrated by the United States Government report on the recent outbreak of foot and mouth disease. A vaccine farm near Philadelphia had procured from Japan what was supposed to be a new culture of cowpox, and the virus from this culture was sold to another vaccine

farm near Detroit. Then followed the disastrous outbreak of foot and mouth disease, which spread through several States and was suppressed only at great expense. In the Government investigation that followed it was proved that the disease had originated in the new culture of "cowpox," which was found to be a culture of foot and mouth disease. (41)

But of whatever disease it may be a culture, all vaccine virus is the putrid product of disease; and this is what mothers are asked to put into the blood of their children! The blood is the life giving stream on which all the fortress of the body depend. Maintain its purity and the body will be in health. Defile it and the body will be diseased. This proposition is axiomatic and needs no demonstration. Yet vaccination involves a denial of it. The vaccinator would improve on the blood formed in the laboratory of Nature. He would perfect it by admixture with diseased pus! For the support of a position so contrary to the instincts of reason a large burden of positive proof is imperative. And what proof has been given? Constant shifting of theory and practice; broken down claims of immunity; discredited statistics, and a virus the mystery of which is equaled only by its danger.

The regulation pertaining to vaccination in Japan, enforced from January 1, 1886 (translation of the important points only):

First Article: A child must be vaccinated within a year after its birth. In case the result proves unsatisfactory, it must be repeated by three inoculations during the year.

Second Article: Notwithstanding that the result of vaccination proves satisfactory, it must be repeated after five to seven years, and again after the next five to seven years.

Third Article: In the event of prevalence of smallpox, the authority will enforce vaccination within any prescribed period irrespective of the Articles First and Second.

Fourth Article: Physicians must grant a certificate of the result of vaccination, whether it has taken effect or otherwise.

VACCINATION: ITS FALLACIES AND EVILS

All fallacies classified as science must crumble before investigation. Such has been the fate of all the pretentious theories of earlier medicine, and such is the predestined end of the delusive hypotheses upon which are based many of the medical dogmas of today.

Of these dogmas I believe the practice known as vaccination to be most absurd, and most pernicious. I do not believe that a single person has ever been protected from smallpox by it; while I know that many serious bodily evils and even deaths have resulted from its employment.

Although I had often seen bad results following vaccination, like the majority of the profession, I never questioned the authority of the books regarding its prophylactic power against smallpox till my attention was specially directed to the subject, in 1872.

As severe epidemic of smallpox prevailed in New York, during that year, notwithstanding the fact that the health authorities had claimed the year previous, that the city was thoroughly protected by vaccination. The various medical societies appointed committees to enquire into the causes of the epidemic and why vaccination had failed to prevent it. I was appointed a member of such a committee from a medical society to which I belonged, and then, for the first time, I began a careful study of the subject of vaccination. I commenced with Jenner's own writings and carefully followed the history of the

subject as prepared by himself and his disciples, and before I got through I was forced to the conclusion that vaccination was the most stupendous fallacy that had ever been fostered by the medical profession. Since then, facts and figures have accumulated, in my hands, to such an extent as to compel me to abandon the practice of vaccination and to come out squarely in opposition to it.

In my knowledge of this subject prior to 1872, I do not think I was an exception to the majority of the profession. All our medical textbooks assert that vaccination is prophylactic against smallpox. In proof of this, they refer to the great ravages of the disease prior to the discovery of Jenner, and its decrease since that time. The professors in our medical colleges instruct the students in the same way, and when they, in turn, are asked for an opinion, the universal answer is, "certainly, vaccination is a sure preventive against smallpox." Few physicians attempt to investigate the subject further.

They have been taught to believe in vaccination, and it is unpardonable heresy to dispute its efficacy. Those who are opposed to it are denounced as ignorant, while in reality they are the only ones who are fully informed on the subject; and the time is not distant when the public will become so enlightened regarding this fallacy, that the vaccinator's lancet will be left to rust beside its twin monstrosity, the bloodletter's lancet.

Many believe in the value of vaccination because the medical profession generally recommend it. To such I would say, that twenty years ago the entire medical profession believed that bloodletting afforded the only relief in all kinds of fever, and that a drink of water given to a fever patient was certain death. A few reformers denounced this barbarous practice and some of them lived to see its complete overthrow, while the "leading minds in the profession" fought for it to the last. The leaders of the abolition movement in America were regarded as lunatics and some of them narrowly escaped death at the hands of the mob, but they lived to see their principles triumph and themselves honored by the whole civilized world. Thus it has ever been with every effort at reform—with every struggle of truth against error—and so it will be in this opposition of organized medical despotism to the enlightenment of the people regarding the monstrous and barbarous practice of vaccination.

Every intelligent person who takes the time to investigate this subject, will find abundant evidence in the published writings and public records of the advocates of vaccination, to prove its utter worthlessness, without reading a line of anti-

vaccination literature. And if we could add to this all the suppressed facts, we would have a mass of evidence before which no vaccinator would dare to hold up his head.

With the view of presenting the subject in its proper light we shall consider:

- 1) The History of Smallpox.
- 2) The History of Vaccination; and
- 3) The Evils of Vaccination.

CHAPTER 1

THE HISTORY OF SMALLPOX

There is a great diversity of opinion among medical writers regarding the antiquity of smallpox. Some assert that it was one of the plagues that so often devastated the oriental nations of antiquity. Others affirm that it prevailed in China and India, a thousand years before the Christian era, but that it was confined to very narrow limits, for centuries, till it finally spread into Europe, about the beginning of the eighth century. Certain it is, however, that we have no description of any disease having the characteristics of smallpox until the latter half of the sixth century, when it is described as breaking out in Arabia, A.D. 571—the year in which Mahomet was born. It was widely disseminated by the wars and expeditions of the Arabs, and is believed to have entered Europe at the time of the overthrow of the Gothic monarchy in Spain, by the Moors. Whatever its source or time of appearance it extended over Europe with fearful rapidity; and the loathsomeness of its nature and the terrible havoc to life attending it, filled the minds of the people with the greatest dread.

It is characteristically a contagious disease, and cannot be communicated except by actual contact with the person or the effluvia arising from the excretions of the afflicted, or with the clothing impregnated with the virus from the pustules. This fact was early recognized; and its spread into different countries was always supposed to be traceable to direct importation. On this point Sir Thomas Watson, in his Practice, says:

"While almost all men are prone to take the disorder, large portions of the world have remained for centuries entirely exempt from it, until at length it was imported; and that then it infallibly diffused and established itself in those parts."

Smallpox was unknown in the New World before the discovery by Columbus; but it was carried into St. Domingo in 1517. Three years later a negro, covered with pustules, was landed on the Mexican coast, and from him the disease spread so that in a short time, it is said, three millions and a half of people perished from it in Mexico alone. The absurdity of this claim of the vaccinators is too apparent to demand any attempt at contradiction. The population of Mexico in 1876, was 10,000,000. It certainly could not have been 3,000,000 in all, in 1520;

and even so, what means could have been employed at that time, to ascertain the number of deaths from smallpox. The disease was carried to Iceland in 1707, and to Greenland in 1733. Wherever it went devastation followed in its train; and so great was the popular dread that the people were willing to adopt any means that offered the slightest immunity against its ravages.

An examination of the statistics of smallpox proves that its greatest ravages occurred at the time when the commercial communications of the various nations began to be more general, and that the first ravages of the disease were greater than any subsequent ones. It would appear as an epidemic in various quarters of the globe and at various times, but it rarely proved as fatal as the first visitation. This was, no doubt, due to the fact that fear kept people from exposing themselves, and led to the practice of isolating the victims during the entire continuance of the disease.

As early as 1713, an English physician who had settled in Constantinople, wrote to a practitioner in London, concerning a new process, which was claimed to be successfully employed as a preventive against the ravages of smallpox. This process consisted in taking the virus of the smallpox and introducing it into a slight puncture in the skin, thus producing the disease, it was claimed, in a milder form. This practice was called inoculation, and was introduced into England by Lady Mary Wortley Montagu, wife of the British Ambassador at the Ottoman Court. She had her own children inoculated, and was so zealous in her work, that by the middle of the century, (1750) the practice had been extensively adopted in England, and had spread to various countries of Europe, and even to America. Its advocates claimed that the ravages of smallpox were thus greatly diminished, and the profession and public, alike, worked zealously to promulgate the practice. After vaccination was introduced, it was ascertained that inoculation added greatly to the number of smallpox cases, and that the mortality was not diminished, but rather increased. Stringent laws were then passed, in different countries, making the practice of inoculation a crime.

CHAPTER 2

THE HISTORY OF VACCINATION

In 1798, Edward Jenner, of Gloucestershire, England, called public attention to his discovery, that the virus of cowpox introduced into the human body, was a prophylactic against smallpox. His attention had been directed to the subject several years previous, by hearing a milkmaid say that she could not take smallpox because she had had cowpox. On examination, he ascertained that cows were often affected with a pustular eruption on the udder, and that the persons milking them were frequently affected by similar eruptions on their hands; and the popular belief was, that persons thus affected were not susceptible to smallpox. He soon began to experiment, by inoculating persons with the lymph from the cowpox pustules, and as these persons did not have smallpox afterward, he thought he had proved the truth of the popular belief in the prophylactic power of the cowpox.

In order to convince those who doubted the value of this pretended discovery, he experimented, by inoculating with smallpox virus, those he had previously inoculated with cowpox virus. Some of the persons thus experimented on did not have the smallpox, but unfortunately for his discovery, others fell victims to his experiments. He then discovered that there were two kinds of eruptions met with on the udder of the cow, one of which was spurious cowpox, and not protective against smallpox. The spurious was a spontaneous eruption, peculiar to the cow, while the genuine was produced by contagion from the grease in the horse. This grease, passing through the cow, and then inoculated into the human body, Jenner declared, as early as 1798, to be a preventive of smallpox "for life." This is Jenner's *wonderful discovery*, which has since been known as vaccination.

On this subject, Jenner writes, as follows:

"In this dairy country, (Gloucestershire) a great number of cows is kept, and the office of milking is performed, indiscriminately, by men and maid servants. One of the former having applied dressings to the heels of a horse affected with the grease, incautiously milked the cows, with some particles of the infectious matter adhering to his fingers. The disease thus communicated to the cows, and from the cows to the dairymaids, spread through the farm until most of the

domestics and the cattle feel its unpleasant consequences. This disease has obtained the name of cowpox."

In describing the disorder thus contracted, he further says:

"Inflamed spots begin to appear on the hands, sometimes on the wrists, which quickly run on to suppuration. Absorption takes place and tumors appear in each axilla. The system becomes affected, the pulse is quickened, and shivering, with general lassitude, and pains about the loins and limbs, with vomiting, come on. The head is painful and the patient is every now and then affected with delirium. These symptoms generally continue from one day to three or four, leaving ulcerated sores about the hands, which commonly heal slowly, frequently becoming phagedenic, like those from whence they sprung. The lips, eyelids, nostrils, and other parts of the body are sometimes affected with sores. No eruptions on the skin have followed the decline of the feverish symptoms in any instance that has come under my inspection, one only excepted. Thus the disease makes its progress from the horse to the nipple of the cow, and from the cow to the human subject. What renders the cowpox virus so extremely singular is, that the person who has thus been affected is for ever after secure from the infection of the smallpox."

Of the pustular sores that appear spontaneously on the nipples of cows, he says:

"This disease is not to be considered as similar in any respect to that of which I am treating, as it is incapable of producing any specific effect on the human constitution."

Both of these points are reiterated again and again in his writings, so there can be no misunderstanding the source from which he derived his virus for what he called effective vaccination.

After he had settled this point satisfactorily to himself, reports came to him that even persons affected with the true cowpox had not been protected from smallpox. He then made the assertion, that it was only in a certain state of the pustule that virus was afforded capable of imparting to the constitution its protecting power; and that matter, taken after this period, might excite a local disease, but not of such a sort as to render the individual proof against the effects of variolus contagion. Then, he pretended, that if kept a few days, the virus underwent decomposition, and was thus rendered incapable of affording

protection against smallpox. Thus, as the Arabian prophet had new revelations to meet every unexpected exigency, so Jenner advanced a new theory every time that vaccination was shown to be a failure.

For a time Jenner's discovery was bitterly opposed by the profession; and even some of those who adopted it, claimed that inoculation directly from the grease of the horse, into the human body, was as protective as that which passed through the cow. Then came the claim that the virus taken from the person inoculated with the cowpox could be used to protect other persons; and, as the symptoms thus produced were less severe than direct inoculation from the cow, this method of vaccination soon became the prevailing one. At first, however, it was considered necessary to have recourse to the cow for a fresh supply of virus, every few years; but even this was soon regarded as unnecessary, and so the practice of vaccination from arm to arm was almost universally relied upon as a preventive of smallpox, for half a century.

From England, vaccination was introduced into the various countries of Europe, crossed the Atlantic to America, and even found its way to the jungles of Asia and to the barbarous tribes of Africa.

The movement took hold of the popular mind, and the medical profession accepted it on the same principle that they discontinued bloodletting. Then compulsory vaccination laws were passed in many of the countries of Europe—and the practice has come down to us as "*the grandest discovery of modern times.*"

At first, all agreed with Jenner, that one vaccination protected a person for life, against smallpox; this, however, was soon found to be untrue. Then, one thorough vaccination in infancy and one after puberty, were deemed necessary. This also proved a delusion. Its advocates next advised the practice to be repeated at maturity. Then it was thought necessary that it should be repeated every seven years; and now, to insure perfect immunity, it is claimed, that every one should be vaccinated every two or three years.

This is the position occupied by most of the profession at the present day, although even here there is a marked difference of opinion among the so-called best authorities.

In the London Lancet of March 24, 1877, the editor writes as follows:

"After successful vaccination in infancy, revaccination is needed only once. The second operation should, if practicable, be performed at the age of puberty, or, there being immediate danger of smallpox, at the age of twelve. Revaccination at an earlier age is futile. Repeated revaccinations are foolish. Revaccination, when successful is needed once only."

As the question now stands, it is impossible to ascertain what constitutes effective vaccination. In every country where it is practiced, the profession are divided respecting the merits of humanized and bovine virus. One party claims that vaccination from arm to arm is more certain, while it can do no harm. The other contends that it does not protect, and that numerous diseases are communicated thereby, while they claim that the bovine virus is certain and harmless. The bovine virus, that is thus advocated, has been obtained by inoculation from the spontaneous cowpox, and Jenner declared that this would not protect against smallpox.

Again, some have advocated the inoculation of a cow with smallpox virus, to obtain a supply of vaccine virus, while others claim that this only spreads the smallpox.

The truth is, that no two physicians agree as to what constitutes effective vaccination. Some still agree with Jenner, that one vaccination is sufficient; others take sides with the *Lancet*, and believe that only one revaccination is necessary. Some say we must vaccinate every seven years, while others still, affirm that we must be vaccinated every two or three years to be perfectly protected against smallpox.

Whatever way we look at the question, it is certain that none of the methods now employed correspond with the discovery of Jenner; and the time is not far distant, when all will be rejected.

Had Jenner been a conscientious searcher after truth, he never would have asserted, six years after he commenced his investigations, that the vaccine disease "for ever after secured against the infection of smallpox." Had he been a real scientist he would never have invented new theories to account for every failure in the results of his investigations, at least, till a sufficient number of years had elapsed to prove the general truth of his assertion. Had he discovered any actual scientific truth, it would have come down to us precisely as he gave it to the public in 1798.

Physiology teaches us that all poisons are either eliminated from the body, or so interfere with the functions and tissues as to produce disease or death. When zymatic poisons, such as those of smallpox, scarlet fever, measles, etc., are introduced into the system, the normal functions are interfered with and thus we have a condition that is called disease. A conflict goes on between the vital forces and the poison, and one or the other must succumb. If the vitality of the patient is sufficiently strong, or in other words, if the patient is healthy and robust, the poison is eliminated, and the body is left with its component parts in the same conditions as before its introduction. If, on the other hand, there is not sufficient vitality, the poison gains the ascendancy and the patient dies. Poisons such as syphilitic may remain in the system for a long time, but when they do, they manifest themselves by abnormal conditions of the various tissues, which result from the efforts of nature to throw off the morbid influence.

Persons who are exposed to the contagion of smallpox, when in a debilitated condition are liable to take the disease, while those who are strong and robust may escape entirely, have it lightly; and the same is true of all other diseases. "When a specific virus is introduced into the body by inoculation, it is more apt to affect the system; but even here some escape infection altogether, others are slightly affected, while some suffer severely in consequence. Those who cover throw off the poison entirely, and may be similarly affected at any time afterwards, provided they are exposed to the infection while in a debilitated condition. This fact has been so often demonstrated by persons having scarlet fever, measles, cholera, diphtheria and smallpox, two and three times, that its truth cannot be questioned. Now what is true of these diseases must also be true of the vaccine disease, and it is for the same reason that vaccination may be repeatedly performed on the same person, and be found to take each time. Then I ask, is it reasonable to suppose that vaccination can protect against smallpox, when it cannot protect against itself, and when one attack of smallpox cannot protect against another.

The very first person Jenner vaccinated and pronounced safe "for life" against smallpox, afterwards took the disease and died from it, and ever since that, the history of the subject proves that such results are so frequent, that the value of vaccination as a prophylactic against smallpox is completely disproved.

But we are told, that vaccination has arrested the fearful ravages of smallpox, and reduced its mortality to almost nothing. We have been told over and over

again that smallpox had been stamped out in different localities, by efficient vaccination; and after it had again appeared the cry came, "the people are not half vaccinated."

Now what is the truth of this matter? It is simply this that the first visitations of all epidemics are more fatal than subsequent ones.

The plagues that formerly devastated the Eastern world were less and less severe with each visitation, till now they have entirely disappeared. Those that swept over Europe up to the beginning of the eighteenth century also became less fatal with each return, till now they are unknown. Cholera, which, at one time, carried panic and death to almost every door, can now hardly gain a foothold in any civilized country. And smallpox, too, had gradually become less prevalent, and less fatal, till in Jenner's time it appeared in a very mild form and attended with but little mortality. To what can we attribute the decline of these diseases? I suppose, had Jenner pretended that vaccination was prophylactic against all, it would be so asserted today; but this change occurred in some of them before Jenner's time, and he cannot even claim the diminution of smallpox as depending on a discovery that had not then been promulgated. No! The only pretense that can be advanced to account for this decreased mortality, is that civilization brought knowledge of hygienic and quarantine advantages; and as these measures were adopted the diseases declined.

In 1864, a report was published in England, in which tables were compiled to prove the value of vaccination. They commenced with the year 1838, which was before the compulsory vaccination laws were passed, and ended in 1861. The unfairness of their figures becomes apparent when it is known that smallpox prevailed more in 1838 than any time during the century, and then no returns are given for the years 1843-44-45-46, because epidemics prevailed and the deaths had increased in those years. The following is a summary of the table:

For the years 1838, 1839 and 1840, before the compulsory vaccination act was passed, the annual average death rate was claimed to be 11,944. From 1841 to 1853, vaccination was provided gratuitously but was not obligatory, and the average annual death rate was 5,221, not including the epidemics of 1843 to 1846, which are omitted from the reports.

From 1854 to '61, inclusive, vaccination was obligatory, and the annual average death rate was 3,240. Here they stopped and claimed for vaccination the

difference in the annual death rate, between 11,944, and 3,240.

In the last year included in their table the number of deaths was 1,320.

In 1862, which is omitted from the table, it was 1,628;

-in 1863, 5,964;

-in 1864, 7,684;

-and in 1865, 6,411;

-and again in 1871, the deaths were 7,876 in London alone.

Now if vaccination reduced the death rate from 16,268 in 1838, to 1,320 in 1861, what increased the death rate so much in the four succeeding years, and in 1871?

The facts in regard to the stamping out of smallpox in England, as reported by the Registrar General, are summarized as follows:

Vaccination was made compulsory by act of Parliament in the year 1853; again in 1867, and still more stringent in 1871. Since 1853, we have had three epidemics of smallpox, each being more severe than the one preceding.

	Date	Death from Smallpox
1st	1857-58-59	14,244
2d.	1863-64-65	20,059
3d.	1870-71-72	44,840

Increase of population from 1st to 2nd epidemic....7%

Increase of smallpox in the same period, nearly..... 50%

Increase of population from 2d to 3rd epidemic.....10%

Increase of smallpox in the same period.....120%

Deaths from smallpox in the first ten years after the enforcement of vaccination, 1854 to 1863.....33,515

In the second ten years, 1864 to 1873.....70,458

The Registrar General in his *Annual Summary* for the year 1880, tabulates the smallpox mortality of London for the last forty years as follows:

Decades	Estimated Mean Population	Smallpox Deaths
1841-50	2,103,487	8,416
1851-60	2,270,489	7,150
1861-70	3,018,193	8,347
1871-80	3,466,486	15,543

In addition to these facts, the same returns show that for the year ending December 31, 1881, 2,371 persons died in London of smallpox.

Again, a careful examination of all returns of smallpox shows that the highest mortality in any one year, in London, in the last century, was 3,992; while the total deaths from this disease during the first twenty years of the present century, was 20,462, or an annual average of 1,023, when neither inoculation or vaccination was practiced to any extent. From the passage of the registration act in 1838, to 1853, when the Compulsory Vaccination Act was passed, the official returns of the Registrar General show the total number of smallpox deaths to be 10,521, which makes an annual average of 1,032. For the 24 years of compulsory vaccination ending with 1877, the annual average death rate was 1,092. Again, for the decade ending with 1880, and with 93% of the population protected by vaccination, the average annual death rate increased to 1,554; while during the year 1881, it was further increased to 2,371.

In Sweden from 1775 to 1792, without vaccination the deaths from smallpox per million inhabitants ranged from 300 to 900 per year. From 1802 to 1810, with from two to forty persons in every thousand vaccinated, the deaths per million inhabitants per year, were successively, 600; 600; 600; 450; 600; 850; 750; 1,000; 300.

The following table shows the ratio of the subsequent years:

Year	Vaccinated per 1,000 Inhabitants	Deaths per Million Inhabitants
1825	250	400
1839	590	575
1851	735	700
1874	970	960

In the face of these figures, is it not absurd to claim that vaccination has stamped out smallpox in England and Sweden.

The same result is demonstrated by the official returns of Prussia, as shown in the following table:

Year	No. of Persons Unvaccinated in every 100,000	Deaths from Smallpox to every 100,000 inhabitants
1820	68,000	10
1831	48,000	12
1811	33,000	14
1850	22,000	16
1860	15,000	19
1871	12,000	243
1872	12,000	260

In the great smallpox epidemic of 1870-72, at Cologne, 2,400 persons took the disease, of which 2,351 were vaccinated and the majority revaccinated, while only 49 were unvaccinated. At that time the population of Cologne was 125,000, of which 8,000 were unvaccinated. This gave one case of smallpox to 53 vaccinated persons, while there was only one case to every 161 of the unvaccinated.

Valuable statistics have also been collected from hospital reports, which further demonstrate the fallacy of vaccination. From 1700 to 1779, there were collected from hospital reports, 24,994 cases of smallpox, of which 4,707, or 18.83% died. From 1836 to 1880, of 48,248 hospital cases, 8,926, or 18.5% died. Of the first, none were vaccinated, while of the latter, 34,423 were reported as protected by vaccination.

VACCINATORS FALSIFY STATISTICS

The statistics above quoted are at variance with many of those presented by the advocates of vaccination, who have persistently kept up a system of falsification and misrepresentation, to bolster up their crumbling fallacy.

The National Vaccine Establishment of England, was created by Act of Parliament in 1808. The Board of Managers of this establishment in their report for 1811, wrote as follows:

"Previous to the discovery of vaccination, the average number of deaths by smallpox within the London bills of mortality was 2,000 annually; whereas during 1811, only 751 died of the disease," etc.

In 1818 this Board again says:

"Instead of 2,000 deaths by smallpox, which was the annual average previous to the practice of vaccination, there died in 1818, only 421."

In 1826 we find in the report of this same Board these words:

"But when we reflect that before the introduction of vaccination the average number of deaths from smallpox was annually about 4,000, no stronger argument can reasonably be demanded in favor of the value of this important discovery."

Again, in 1836, the paid officials of this vaccine establishment, encouraged by the fact that their report of 1826 had not been questioned, still further falsify facts by the following report:

"The annual loss of life by smallpox in the metropolis before vaccination was established, exceeded 5,000."

Contrast with these statements the official report of Dr. Farr, and we have a fair illustration of the manner in which vaccination statistics are manipulated in England, and in every other country, where the paid advocates of vaccination and the producers of the virus feel called upon to keep up the popular delusion concerning the prophylactic value of vaccination.

Dr. Farr states the facts in these words:

"Smallpox attained its maximum mortality after inoculation was introduced. The annual deaths from smallpox in London, from 1760 to 1779, were on an average 2,323. In the next twenty years, 1780 to 1799, they declined to 1,740. The disease, therefore, began to grow less fatal before vaccination was discovered, indicating, together with the diminution of fevers, the general improvement of health then taking place."

These are facts that cannot be gain said, and they irrefutably disprove the assertion that 40,000 died annually in England, before the introduction of vaccination, which is the claim made by vaccinators to prove the value of their vaunted prophylactic.

In the reports of smallpox hospitals, a number of cases are always reported as unvaccinated; and in the fatal confluent cases, where vaccination marks could not possibly be seen, and where no inquiry has been made regarding previous protection, they are invariably returned as unvaccinated. I have personal knowledge of several such cases in New York, during the past winter.

An expose of this kind was made in 1875, by Mr. John Pickering, of Leeds, England. The Leeds' smallpox hospital had reported 715 cases treated, from January 29, 1872, to October 24, 1875, of which they reported 600 vaccinated and 115 not vaccinated. Mr. Pickering and his friend Mr. Kenworthy, investigated about half of this number, and though they could find no trace of many of the patients, they ascertained the following facts six living witnesses were entered "unvaccinated," all of whom had been vaccinated; nine deceased persons were entered "unvaccinated," all of whom had been vaccinated; eight cases entered as "unvaccinated," should have been entered unsuccessfully vaccinated; four cases were entered "unvaccinated," which should have been returned "certified unfit."

Proofs of these facts were presented to the Leeds' Board of Guardians, with the offer to continue the inquiry over the other cases, but an investigation was refused.

This is but another sample of the manner in which statistics in support of vaccination are manufactured, but such figures cannot deceive any one who is

earnestly endeavoring to ascertain the truth concerning this important question.

VACCINATION IN AMERICA

In quoting statistics on smallpox and vaccination, we obliged to use those of foreign countries, for the reason that none are accessible in America. Even the Boards of Health of our large cities make no effort to ascertain whether those attacked with smallpox have been vaccinated.

In New York and Brooklyn, repeated endeavors have been made to stamp out smallpox by thorough and systematic vaccination. It has been made compulsory in our schools, and during the past ten years, revaccination has been demanded, or in its place a certificate from a physician that revaccination was unnecessary. Vaccinators have gone from house to house, to vaccinate old and young, and it is claimed by the Health Board of New York, that they have vaccinated 800,000 persons during the past eight years.

The profession generally have enjoined the people to have recourse to repeated revaccination, and with 3,000 physicians in private practice in New York, it is certain that the entire population, with very few exceptions have been vaccinated from one to six times. Yet smallpox prevails, and this protected people are as much in dread of the disease as if they had never been vaccinated.

For the past ten years I have rarely met persons marked with smallpox, without asking them if they had been vaccinated; and in almost every case I received an answer in the affirmative, while many knew of a number of cases of deaths from smallpox, among friends who had been vaccinated and revaccinated. During the past year I have known of several cases of smallpox in persons who had been revaccinated and pronounced thoroughly protected by the public vaccinators, notwithstanding the declaration of Dr. Taylor, the chief of the Vaccination Bureau, that "Vaccination is an absolute protective against variola."

In 1872 and 1873, I corresponded with over two hundred medical men, and questioned them on the value of vaccination in their experience. The aggregate number of smallpox cases seen by these physicians was 6,423; of which 4,020 had been vaccinated, and 3,008 of these revaccinated. In my own practice, I have seen 20 cases of smallpox, of which fifteen had been vaccinated, and eleven of

these revaccinated. Of my own cases, four died, three of whom had been vaccinated, and one of the three revaccinated, while the fourth was that of a child who had not been vaccinated on account of poor health.

THE VACCINATORS' CHANGE OF BASE

After the advocates of vaccination were forced to abandon the claim that it protected for life against smallpox, they declared that when vaccinated persons did take the disease, it was only in a mild form. This was disproved, even in Jenner's time, by the death, from smallpox, of persons who had been vaccinated, and such cases have multiplied to such an extent with every epidemic, that another change of base was found necessary.

Revaccination every few years was then advocated as a certain means of mitigating the severity of smallpox, and still deaths occurred.

It is now the custom to claim that every person who escapes smallpox, whether vaccinated once or a dozen times has been protected by the vaccination; while it is asserted that the vaccination was not properly performed, in all cases where smallpox does occur. In other words, they claim that we are protected till the breaking out of the disease proves the contrary, and then they assert that we had no proper protection.

gain, every mild case is pronounced varioloid, if found among the vaccinated, and variola, if seen in the unvaccinated. This claim is entirely without foundation in fact, as it is well known that all diseases attack persons with different degrees of severity, the strong and robust being slightly affected, while the weakly suffer severely. One child is very sick with measles, while another in the same family may have the disease so slightly as not to affect it in the least; one may die from scarlet fever, while another may only be slightly indisposed for a few days; one may have the whooping cough for a week or two, while another may suffer from it for months.

One person may die from cholera in a few hours, while another may have it severely, and yet recover; and one may feel slightly indisposed from malarial influences, while another may be a great sufferer for months, from the same cause. This being true, is it reasonable to suppose that smallpox should be an

exception to the general rule, and only those who have been vaccinated, have it lightly"? Certainly not; the facts prove that it is the weakly who die from smallpox, whether they have been vaccinated or not. And, besides, it is the rule not to vaccinate delicate, sickly children, and when such take smallpox they are more liable to die, and the want of vaccination is assigned as the sole cause of the disease.

THE PROPHYLAXIS OF VACCINATION HAS NEVER BEEN TESTED

Notwithstanding all that has been claimed in favor of vaccination, I contend that its prophylaxis against smallpox has never been tested. Ever since its introduction, the most rigid quarantine regulations have been enforced in all smallpox cases, and from the very nature of the disease, it must be admitted that such measures, of themselves, are calculated to prevent its spread, while superior knowledge enables physicians to treat it more successfully than formerly.

In all large cities, contagious diseases, including smallpox, prevail most extensively and fatally in the low-lying, badly drained and ventilated, filthy and densely populated districts, where contagion cannot be prevented; and in these districts, too, vaccination has been almost universally performed, because it has been enforced and done without charge.

If vaccination and revaccination will certainly prevent smallpox, why do its advocates insist on the enforcement of quarantine regulations? Why do they exclude unvaccinated children from our public schools? Why are those who have been protected by repeated vaccinations so panic stricken when a case of smallpox is discovered in their midst? Certainly these facts prove that they have no faith in their vaunted prophylactic. The whole history of the way vaccination protects against smallpox is summed up in the action of the New York Health Board, as illustrated by their management during the past winter.

A case of suspected smallpox is reported, and an inspector is sent to examine the patient. The diagnosis is confirmed and the patient is removed before vesication takes place, which is before the period of contagion. The house is then thoroughly fumigated, antiseptics are used in every direction, and then all the inmates are thoroughly vaccinated. If no other cases occur, the credit is given

entirely to the protective influence of the vaccination; while the removal of the patient before he could possibly communicate the disease, and the hygienic measures employed, are never mentioned.

If vaccination is the vaunted protective it is claimed to be, why not depend on it alone? Why not prove by actual facts that the vaccinated are safe from smallpox under all circumstances, while the unvaccinated are certain to take the disease whenever exposed to it? This cannot be done, but on the contrary thousands have lost faith in vaccination because of its repeated failures.

All the protection we have against smallpox comes from our improved knowledge of the hygiene of the person, the home, and the community; and if 1/4 of the money that is now spent to support a vaccination aristocracy was applied to improving the conditions of life in localities where smallpox usually originates, we would not only banish smallpox, but with it all other zymotic diseases. I contend that vaccination, without quarantine and hygienic conditions, would show an enormous increase of smallpox in a very short time, while the strict observance of the latter, without vaccination, would tend to improve the general physical condition of our people and this further diminish the fatality of smallpox.

Until the advocates of vaccination are willing to depend on their own prophylactic, they should cease to urge it upon those who have no faith in it.

CHAPTER 3

THE EVILS OF VACCINATION

Even if there was any evidence to prove that vaccination was a prophylactic against smallpox, the appalling evils that have been and are still produced by it are sufficient to condemn the practice as a crime.

Every physician of experience has met with numerous cases of cutaneous eruptions, erysipelas, and syphilis, which were directly traceable to vaccination, and if these could all be collected and presented in one report, they would form a more terrible picture than the worst that has ever been drawn to portray the horrors of smallpox.

In 1872, I condensed into a report, the following summary of evidence (under oath), taken by a committee of the British House of Commons, in 1871, on this subject. It speaks for itself:

Dr. Collins testifies:

"After twenty years experience as a vaccinator, during six or seven smallpox epidemics, I have ceased to vaccinate ten or twelve years; and gave up at least £500 sterling a year by so doing. I consider vaccination not only useless, but an evil. Have often seen children with syphilitic eruptions, after vaccination, whose parents were free from any taint. Have seen children, hitherto healthy with no trace of struma, after vaccination assume a scrofulous character, with every characteristic of a strumous habit. Erysipelas and phlegmanous ulcers are also by no means uncommon after vaccination. In a particular case I vaccinated an apparently healthy child with lymph from the national vaccine establishment, and on the eighth day, from a true Jennerian vesicle on its arm, I, at the request of the parents, friends of the first, vaccinated another healthy child; and three weeks after both children were brought to me, having decided syphilitic symptoms; when, on examination, it was found that the father of the first child had constitutional syphilis. The parents of the second child were perfectly healthy, but the syphilis had been conveyed to it by the vaccine lymph taken from the other. Was once consulted by some young ladies who had been vaccinated from their brother, who had been suckled by a syphilitic nurse, and,

on being discovered, it was found that her own child had the usual syphilitic symptoms."

Dr. Pearce testifies:

"I have given special attention to the subject of vaccination for 18 years. Returns show a large increase of consumption. I knew a lady and her elder brother, unvaccinated, the only survivors of 10 children, the rest having been vaccinated, 5 of whom died in childhood, and the remaining 3 at from 15 to 18, of consumption. The mother always attributed the death of her 8 children to vaccination. The ancestors on both sides for generations were all healthy country people. There was no defect of nutrition, no re-breathed air of workshops.

"When vaccinating, as I formerly did extensively, I was astonished to find that I had unwittingly transmitted syphilis from lymph supplied by the Jennerian Institution; I had proved that no taint existed in the parents; had 20 or 24 such cases within four years at Northampton."

Referring to the 540 practitioners who are reported to have taken grounds against his positions, he says:

"They are chiefly surgeons of hospitals, who perhaps have never vaccinated or been in general practice; the answers of such men are of no value. Mr. Whitehead, of Manchester, reports several instances of syphilitic taint, transmitted from a true Jennerian vesicle. This is positive evidence; but men may say that they never have seen what they never had an opportunity of seeing. Dr. Ballard had stated that a true Jennerian vesicle cannot be distinguished from a vesicle containing syphilis."

Dr. J. J. Garth Wilkinson testifies:

"I have vaccinated to within the last five years without thinking about it. Vaccination is so entirely *secundem artem*, the large majority cannot think about it. We are continually coming upon venerable fallacies; but on this question prestige and interest prevent investigation. Six positive cases are worth 10,000 negatives, which go for nothing."

Dr. Silljestrom, a man of great scientific eminence, and a legislator in Sweden, says:

"I have always felt that if vaccination does not stand against smallpox it is nil; if it does so stand, millions to one but what it imparts other and more powerful disorders into the system. My own coachman's child took erysipelas concurrently with vaccination, and both the child and its mother, who was nursing it, who had had smallpox, died of the erysipelas. Knew a case of an eminent literary man crippled with a skin affection, a kind of eczema of the leg, ever since being revaccinated four years since. Have often, almost daily, heard parents say, "My children have never been the same since they were vaccinated."

Dr. G. S. Gibson testifies:

"I attribute the large increase in infant mortality to their being poisoned in the first year of life, in a greater proportion than formerly, by vaccination. Constitutional diseases may be perpetuated in the same way, and the foundation laid for tubercular disease of some kind."

Prof. Ricord says in a French Medical Journal, of March 10th, 1865:

"At first I repulsed the idea that syphilis could be transmitted by vaccination, but today I hesitate no more to proclaim the reality."

Mr. Emery testifies:

"I have seen much suffering, ulcerous sores, etc., from vaccination. Vaccination is matter taken from the cow, put into the arm, and from arm to arm, for thirty years, and all manner of dirt is scraped out of one person's arm and put into another. I had a healthy child, eleven weeks old, vaccinated in May, 1869. On the ninth day it became very ill, the arm, body, and legs swollen, and turned red and green, having no rest night or day till its death, a month after. Have since seen one hundred to one hundred and fifty healthy children suffering, immediately, after vaccination, and parents who have lost their children by it."

Me. Covington mentions the case of a healthy child, twelve months old, in whom syphilitic appearances showed themselves five weeks after vaccination. His own child was taken ill immediately after vaccination, and suffered for nine months, and afterwards from abscesses, etc., for four years. In a third case, a child of four months, immediately broke out with sores, and died in the tenth month. Believes vaccination conveys consumption, syphilis, and many other like

diseases.

Mr. Adison deposes:

"That on the 8th day of September, 1870, he had a sound, healthy child, three months old, vaccinated against his will, to obey laws; three days after it broke out in a fearful rash, which continued to increase for eight weeks, when it died."

Rev. Hume Rothery testifies:

"I had a healthy child which suffered from a long series of very large boils, coming on three months after vaccination, which I believe to be the cause. Another case, a healthy child, nine months old when vaccinated, was afterwards afflicted with sore eyes for many years, and they are still weak; it being afterwards found that sore eyes prevailed in the family from which she was vaccinated.

"A third case, a fortnight after vaccination, (at nine months old) became covered with an offensive eruption all over the body, is now three years old, and has seldom since been free from sores and scabs; her elder brother, not vaccinated, father and mother, and families are remarkably healthy.

"A fourth case, now four years old, healthy before vaccination, has never since been so; nine months afterwards foul sores broke out, which continued, and appear likely to continue; there is a hole in one hand, and the foot probably crippled for life.

"In a fifth case, vaccinated when a babe, the family all perfectly healthy, cancer appeared on the chin, at eighteen months old, and she lost the left breast from cancer at thirteen.

"A sixth case, exceedingly well before vaccination, was never well afterward. Its flesh rotted on slightest scratch of a pin, and now and then broke out in scales and sores; it died when twenty months old. Six other children were vaccinated from this child, not one of whom survived.

"A seventh case, a healthy baby before vaccination, became ever after an indescribable sufferer, and died at nearly eight, his body being literally rotten; father, mother, and five other children all remarkably healthy.

“In an eighth case, a healthy boy, four months old, was vaccinated; three months afterwards the arm began to break out, the head was one mass of sores, which continued for twelve months; believe it was syphilis; there had never been any disease in parents' families. Could mention a considerable number of other cases, eight—all of deaths—from Rochdale; twelve from Smallbridge, many others from Scotland; all attested before magistrates, with the understanding that they were to be laid before this committee. Could mention a number of other cases, but the sufferers are afraid to come forward. A child may appear healthy, but no one can say where a latent taint exists.”

Dr. Nicholson, a pro-vaccinator, writes:

"If a case can be made out against vaccination, by all means let the law be repealed."

Whilst Dr. Blanc, also a vaccinator, says:

"Persons who deny such transmission are greater foes to vaccination than its declared adversaries."

Mr. Simon testifies:

"There is not the least doubt that syphilis has, on several occasions been communicated on the continent by what was purported to be vaccination. Lymph ought not to be taken from a subject who can be reasonably supposed syphilitic. A vaccinator should assume that such would convey syphilis. Practically, we should expect lymph taken from a syphilitic child would be syphilitic, as the safe side to err on, without attaching importance to negative experiments."

Dr. Bakewell testifies:

"There is a very strong opinion among medical men in the West Indies that leprosy has been communicated by vaccination. They often apply to me for lymph from England, though there would be an equal chance of English lymph being contaminated by syphilis; have seen several cases of leprosy where vaccination seemed to be the only explanation; have a case now, a child from India, a leper, both parents being English; saw another, a Creole of Trinidad, also of English parents Sir Ronald Martin agreed with me that the leprosy arose from

vaccination. Have seen several cases of leprosy resulting from vaccination, arrived at the conclusion with reluctance in the face of difficulties. Have no doubt death resulted from syphilis, produced by vaccination, in the Rivalta cases. There are two hundred and 48 such cases mentioned by Lancereaux as having occurred in France, Italy, and Germany. Think there are others of which we have no knowledge."

Mb. Hutchinson testifies:

"I was asked by the medical man to examine into the communication of syphilis to several adult servants and shopmen who were revaccinated, on the 7th of February last, from one child, lent to the operator from a public vaccinating station. Of thirteen so vaccinated whom I saw on the fourth or fifth of April, eleven had on their arms sores characteristic of syphilis—the primary sore of syphilitic contagion; the two who escaped were the first vaccinated. A few days later saw the child (six months old), from whom the lymph was taken, and though it appeared in good health, I should have no doubt it was the subject of inherited syphilis; it had an eruption on the body, then very slight indeed, and probably not present at the time of vaccination."

Dr. WM. Collins, of London, concludes an article on this subject, in these words:

"I am bound to admit that I have no faith in vaccination, nay, I look upon it with the greatest disgust, and firmly believe that it is often the medium of conveying many filthy and loathsome diseases from one child to another, and it is no protection from smallpox. Indeed, I consider we are now living in the Jennerian epoch for the slaughter of the innocent, and the unthinking portion of the population."

The *Lancet* of November 16, 1861, contained an account of the inoculation of 46 children with syphilis, conveyed by means of vaccination. And in 1866, thirteen children were similarly affected by vaccination from a child, who had been vaccinated with lymph obtained from the medical authorities. On the same subject the *Lancet* of January, 1866 says:

"This highly important subject has been fully treated by the *Siglo Medica*, a Spanish medical paper. In this article we find statistical tables of value. The author, in collecting data respecting instances of syphilitic contamination through the vaccine virus, shows that the disease was communicated in 224 out

of 314 vaccinations."

Volume twelve of the *Union Medicate*, a French magazine, contains a report of the celebrated Rivalta cases in Italy in 1861. In these cases 46 children were vaccinated with virus from an infant that seemed healthy, and seventeen were afterward vaccinated from one of the children of the first series, and of these 44 were affected with syphilis, and they in turn propagated the infection to their mothers and nurses. Dr. Henry Lee, a great authority in syphilis, stated after investigation, that he could come to no other conclusion but that the disease was communicated by vaccination in the Rivalta cases.

Prof. Joseph Jones, of Nashville, Tennessee, of the late Confederate army, published, in 1867, a pamphlet of 164 pages, in which he gives the sworn testimony of many prominent physicians in the Southern States, proving beyond doubt, that many hundreds of soldiers had died from syphilis and gangrene caused by vaccination.

At times when any number of vaccinations are being performed, hardly a week passes without reports of deaths from erysipelas following vaccination. In spite of the utmost care, I frequently met with such cases in my own practice, before I abandoned vaccination, and there are few physicians who have not similar experiences to record.

That erysipelas and infantile syphilis have increased to an alarming extent during the past twenty years, can be proved by the death returns of every country where vaccination is practiced, and the best authorities in the world no longer deny that both of these diseases have been largely augmented by vaccination.

Such cases are being reported from every part of the United States, and the individual testimony of physicians, in private practice, would fill many volumes without exhausting the horrors that have been developed by vaccination.

Vaccinators had long denied that disease of any kind could be communicated by vaccination, but by degrees, many in this country tacitly admitted their error, by substituting bovine for humanized virus.

It was positively declared by the Metropolitan Board of Health, of the City of New York, in 1872, that the humanized vaccine lymph had never conveyed diseases from one person to another. They were actually forced to abandon that

position in less than three years. A bureau was then established, in the department, for the purpose of supplying bovine virus, and all physicians in the city were notified that they should adopt it in their practice. They asserted that this virus was the genuine vaccine lymph, obtained in France from pustules spontaneously formed on the udders of cattle; and have since declared that they use no other. This claim had allayed the fears of the people about the dangers of vaccination, as it was thought no disease could follow the use of this bovine virus. Dr. Martin, of Boston, the New York Health Board, and a number of other enterprising doctors, are now engaged in producing this "virus," which Jenner claimed "did not protect against smallpox," and these are the men who mislead the public by false statistics and are urging the passage of compulsory vaccination laws. But they do more than this. They deceive the people in regard to the kind of virus they use and offer for sale.

At a recent meeting of the First Anti-Vaccination League of America, the writer stated that the officials of the Board of Health collected the scabs from the arms of children vaccinated by them, without regard to the health of the children, and sold them at two dollars a scab. A Herald reporter interviewed Dr. Taylor, chief of the Vaccination Bureau, and he was obliged to admit that such scabs were collected, but were not used at home. He then acknowledged that they were sold for use in Cuba and South America. Is not even this admission enough to stamp the men who claim to supply "only pure bovine virus," as unworthy of public confidence.

The public must not be mislead, however, by the claim, that no disease can be communicated by bovine virus. Domestic cattle are subject to all the diseases to which man is liable, with the possible exception of syphilis, and many careful observers have found those diseases in progress after vaccination. Erysipelas and various cutaneous eruptions are common sequences of bovine vaccination, and Dr. G. H. Merckell, of Boston, has reported cases having all the characteristics of syphilis, following the use of Dr. Martin's virus on children previously healthy, and in whose families no taint of disease could be traced.

On this subject *The Lancet*, (London), June 22, 1879 says:

"The notion that animal lymph would be free from chances of syphilitic contamination is so fallacious that we are surprised to see Dr. Martin, of Boston, Mass., U.S. reproduce it."

When vaccination of all kinds is entirely abandoned, and people are more thoroughly instructed regarding the laws of health all forms of zymotic diseases will be unknown, and the general vitality of the race will be greatly improved.

WHO UPHOLDS VACCINATION?

There are several classes of persons who uphold vaccination:

- 1) The vaccination rings, consisting of the officials of health boards, and public vaccinators, who are yearly receiving millions of dollars from the public treasuries. It is their interest to favor the practice at all hazards, and they falsify statistics in order to conceal its failures and evils.
- 2) Thousands of medical men believe in vaccination because they have been taught to do so, and because the best authorities recommended it. They have vaccinated because it was the custom and they were paid for it. They have supposed vaccination would prevent smallpox, and they never dreamed of making any investigation for themselves, or even giving it a moments thought.
- 3) A rapidly increasing number of the profession, who have no faith in vaccination, tell us that if people wish to be vaccinated they might as well do it and get the fee, as someone else would do so if they did not. The people believe in it and they encourage the belief.

Of the first class we have no desire to speak. They intentionally or ignorantly ignore all the facts of history and aim at making every thing conform to their ideas and wishes. Among the second class there are many sincere men who undertake to defend vaccination, but they cannot see both sides of the question; and with a few old figures and a rehash of the old story, they rush into print to convince the profession and the people of the great value of vaccination.

It is hard to abandon old theories and beliefs. It is harder still to uproot popular fallacies; but that vaccination is doomed to follow into oblivion, the practice of bloodletting, and general depletion, and the numerous other empirical practices that once constituted regular medicine, is as certain as that the sun shines.

THE OPPONENTS OF VACCINATION

Those whose interest it is to keep up the belief in the prophylactic value of vaccination against smallpox, have endeavored to make it appear that anti-vaccinators were bigoted and ignorant, and therefore not entitled to credence. The truth is that they are neither bigoted nor ignorant, but have been compelled to abandon vaccination, after giving the entire subject a careful and impartial investigation. The majority have refused to vaccinate under any consideration, and have relinquished a considerable sum of money, yearly, rather than continue a practice which they believe to be a fallacy and a crime.

They have espoused an unpopular cause, and have made many personal sacrifices to uproot what they conscientiously believe to be wrong. They have had everything to lose and nothing to gain by entering upon this crusade against vaccination, and they are confident that every candid person who will take the trouble to investigate, will enrol themselves on their side of the question. With the conviction that they are right, and with the cooperation of many of the ablest minds the world has ever known, they can afford to smile at the invectives and ridicule of the interested, indifferent, and ignorant physicians, who find it necessary to do everything in their power to perpetuate the popular faith in vaccination.

The following opinions of eminent physicians and savans, will give some idea of the extent of the disbelief in vaccination, and if they are the "ignorant men" of the nineteenth century we have no objections to being classed with them:

Dr. Joseph Herman, principal physician at the Imperial Hospital, Vienna, from 1858 to 1864, says:

"My experience of smallpox during those six years of bedside attendance, has given me the right, or rather has imposed on me the duty, of taking part in the bold and spirited onslaught on vaccination which is now being carried on in Switzerland, Germany, England, and other countries. I am convinced that vaccination is the greatest mistake and delusion in the science of medicine; a fanciful illusion in the mind of the discoverer; a phenomenal apparition, devoid of scientific foundation, and wanting in all the conditions of scientific possibility."

Dr. C.T. Pearce, London, says:

"That the increased death rate of children is coeval with the extension of vaccination; that so far from the practice being protective against smallpox, the liability to smallpox in adult life is greater in the vaccinated than in the unvaccinated."

Sir James Y. Simpson, M.D., Edinburg, says:

"Smallpox can never be exterminated by vaccination."

Dr. Simon, medical officer to the Privy Council, England, says:

"Smallpox after vaccination, has been a disappointment both to the public and the medical profession."

Dr. Caron, Paris, Chevalier of the Legion of Honor, and late Government Physician to Paris Prisons, says:

"Vaccination, so-called, modifies not one tittle of either the virulence or the consequences of the smallpox. I have long since refused to vaccinate at any price."

The *Lancet* (London), January 21, 1871, says:

"From the early part of the century, cases of smallpox after vaccination have been increasing and now amount to 4/5 of cases."

Dr. Vice, Ekerbery, near Stettin, says:

"I should be glad to say a few words about smallpox epidemics, because in the year 1871-72, I had 652 smallpox patients under my care, of whom 431 were French and 221 German, of various origin and ages. According to my experience—from accurate notes taken at the time—vaccination does not exercise the slightest influence in mitigating the force of the epidemic; for many of the patients had been recently vaccinated, some only 14 days, and others within six months of their being seized with the disease. The theory is pro-pounded, that after vaccination, smallpox is less severe. I contest it most vigorously, because the majority of those vaccinated were seized with the genuine smallpox

(variola). Among the French who were not vaccinated, the spurious smallpox (varicella) principally prevailed; which speaks strongly *against* vaccination.

"You must be aware of the injurious consequences so frequently resulting from the vaccination of children. Vainly do I seek to discover the advantages of vaccination." —From papers read at Medical Congress, Chemnitz, Lower Saxony, September 27, 1872.

Dr. Nittinger, of Stuttgart, writes, in 1872, of Wurtemberg:

"In five districts scarcely any medical men practiced vaccination. Out of 462 physicians in the country, only 229 vaccinated. We have to lament that since vaccination, there has been no year free from smallpox; that smallpox hospitals have been built, and are continually open that of 100; patients *before* vaccination, only 6 to 7 died; but since, from 10 to 20 die."

Dr. Charles John Bricknell, Banbury, England, says:

"I shall be ready at any time to state my belief in the inefficacy of vaccination as a preventive of smallpox, and also that the practice of vaccination is contrary to the principles of medical science. I believe it would be a great benefit to mankind if it were rendered penal to vaccinate."

Dr. Leander Joseph Keller, chief physician to the Austrian State Railways, kept a record of the mortality amongst the company's servants and their families, of 373 smallpox cases, during 1872. Dr. K. concludes his paper thus:

- "1. Generally more vaccinated than unvaccinated persons are attacked by smallpox.
2. Revaccination did not protect from smallpox, and did not lessen the general mortality.
3. Neither vaccination nor revaccination exercised a favorable influence upon the smallpox mortality."

Dr. John Simon, medical officer of Privy Council, England, says:

"Vaccination is, or is not a preventive. If it be so, it is effective the first time, and

does not need to be repeated. To say that it requires repeating at stated periods of five, or seven, or ten years, is arrogant humbug and quackery."

Dr. John Simon, medical officer of Privy Council, England, says:

"The smallpox epidemic of 1870-3, was part of a worldwide prevalence of the disease. It seems universally testified by skilled observers, that no smallpox epidemic in living memory had been (if I may so express it) of equally malignant intention with that which is here in question." —Public Health Reports, 1874.

(If this be so, where is the protection of vaccination?)

Dr. Seaton, Superintendent of Vaccination, in his Public Health Reports for 1874, writing of the epidemic of smallpox for 1870-73, says:

"The peculiar intensity of this epidemic was manifested by the extreme diffusiveness of the disease; by its attacking, in unusual proportion, persons who were regarded as protected against the disease, whether by previous smallpox or by vaccination, and by the occurrence with quite remarkable frequency of cases of a malignant and haemorrhagic type, and a consequent unusually high ratio of deaths to attacks."

(Where is the virtue of vaccination, Dr. Seaton?)

Dr. H. Oidtmann, of Linnich, says:

"In Sweden, prior to the introduction of vaccination, in 1801, died of smallpox, 600 persons per 1,000,000 inhabitants, and since vaccination has been assiduously practiced there, the mortality of smallpox has gradually but regularly increased. In 1874, with a population exceeding but little the number of 4,000,000, there died of smallpox, in this State, 4,063, exhibiting thus an increase of more than 400 per 1,000,000 of inhabitants."

Dr. E. Robinson, late Medical Officer of Health, Dunkinfield, England, says:

"Whilst I have shown that the increase of 53 to 75% of smallpox after vaccination, is owing to vaccination as an operation having a tendency to increase smallpox, I wish the reader to understand that I do not look upon this tendency as constituting the most serious of the unsafe conditions inseparably connected with vaccination. The promotion of the other diseases referred to in

former pages is the influence which condemns vaccination as an unsafe remedy."—From "Can Disease Protect Health," 1880, p.32.

Dr. Stramm, Medical Staff Officer, Prussian Army, says:

"I, myself, have been vaccinated, and twice successfully revaccinated; and yet, in the exercise of my official medical duties during the late epidemics in Prussia, I have been attacked with smallpox in the most virulent confluent form, and been only saved from worse consequences by a speedy change of climate."

Dr. Ceely, Aylesbury, England, says:

"They would not be able to annihilate smallpox by vaccination, and he defied any one to show he had claimed such a result; from the experience he had had, no such thing could, or ever would happen." —Address at Calf Lymph Conference, London, December, 1879

Dr. Jules Guerin, Paris, in an address before the French Academy of Medicine, 1881, says:

"A large number of medical men consider a general vaccination and revaccination to be in itself one of the causes of smallpox; a crowd of the newly vaccinated to be itself a dangerous centre of infection; and the 150,000 revaccinations in Paris during the siege to be in some degree responsible for the great epidemics of 1870-1."

Dr. Charles Cameron, member of the House of Commons, England, says:

"Since 1836, our statistics have been compiled so as to enable us to compare the mortality, not merely in smallpox occurring in all classes of vaccinated persons, at different periods, but in each separate class of vaccinated persons—in persons, that is, with 1, 2, 3, or 4 good or indifferent marks. *I have gone into these details, and found that not merely has the mortality in smallpox occurring after vaccination progressively increased in the aggregate, but it has increased in each class of cases, and increased enormously in the best vaccinated classes of cases.*" —Letter in London Times, May 24. 1881.

Dr. J.J. Garth Wilkinson, of London, Eng. says:

"It is demonstrable that vaccination has no influence whatever over the smallpox death rate. For the whole hospital death rate now of vaccinated and unvaccinated is just 18%; almost exactly what it was before vaccination existed."

Prof. Manniell, Royal College Surgeon, Leland:

"The term imperfect or spurious vaccination is frequently met with in books, and has been the cause of no small degree of confusion in practice, although, at the same time, *it has frequently afforded the practitioner an asylum against the storms now and then arising out of failures in the protective power of the vaccine disease.*"

Dr. Copeland, (*Medical Dictionary* pp.832):

"Just half a century has elapsed since the discovery and introduction of vaccination, and after a quarter of a century of transcendent laudations of this measure, with merely occasional whispering of doubt; and after another quarter of a century of reverberated encomiums from well paid 'Vaccination Boards,' raised with a view of overbearing the increasing murmurings of disbelief among those who observe and think for themselves—the middle of the nineteenth century finds the majority of the profession, in all latitudes and hemispheres, doubtful as to the preponderance of advantages, present and prospective, to be obtained either from inoculation or vaccination."

Dr. Felix Von Niemeyer, says:

"It (vaccination) endangers life, and in other cases leaves permanent impairment of health."

Prof. German, M.D., University of Leipsic:

"Above all, the dire fatality which lately occurred at Lebus, a suburb of Frankfort-on-the-Oder, would alone warrant the abolition of the vaccination laws. Eighteen school girls, averaging twelve years of age, were revaccinated, and thereby syphilised and some of them died. Yet the lymph, the syphilitic lymph, used in this case was obtained from the Official Royal Establishment for the new 'regenerated' or 'annualized' vaccine lymph so warmly recommended for the revaccination of schools."

Dr. Kolb, Munich:

"In well-vaccinated Bavaria, famous for compulsion in 1871, out of 30,742 cases, 29,439 were supplied by the vaccinated."

Prof. Francis W. Newman, of London University, says:

"Nothing is clearer to any one who will open his eyes than that what is now called vaccination has no effect in lessening smallpox, and has frequent and terrible effect in doing mischief. The doctors who urge vaccination do not believe in it, for they advise revaccination."

P.A. Taylor, M.P., England, says:

"I have no hesitation in asserting the confident opinion, as the result of much study of the question—historically and statistically—that vaccination is a ridiculous delusion—that there is no evidence that it has the slightest effect as a preventive of smallpox that indeed the negative evidence is all the other way, while the positive evidence of the mischief it has done is incontrovertible."

Adolph Count Bedtwitz, of Austria, says:

"For let medical advocates exhaust themselves as they may in sophisms, it nevertheless remains an eternal truth, that the State has no right to prescribe a medical creed to any man; and no man, with any self-respect, who has once seen through the stupid superstition, the shameless deceit of vaccination, will, without resisting to the uttermost, ever consent to the degradation of allowing the near and dear to him to be subjected to it, or lend a hand to the coercion of others."

Alexander von Humboldt, says:

"I have clearly perceived the progressive dangerous influence of vaccination in England, France and Germany."

Herbert Spencer, writes:

"I wish I had known some time since that the vaccination persecution had in any case been carried so far as you describe, as I might have made use of the fact. It would have served farther to enforce the parallel between this medical popery

which men think so defensible, and the religious popery which they think so indefensible."

Dr. Furber, of Topeka, Kansas, says:

"There is no necessity to resort to such a loathsome imaginary remedy. Vaccination is a humbug; enforced vaccination a crime."

Many more similar opinions might be quoted, but enough has been presented to give an idea of the character of the men who are opposed to vaccination.

DEDUCTIONS

From the facts presented in the foregoing pages, we cannot fail to deduce the following:

- 1) That Jennerian vaccination is neither practiced or believed in at the present day, therefore, he made no discovery.
- 2) No two physicians agree as to what constitutes efficient vaccination, therefore, the practice is empirical and unscientific.
- 3) That the percentage of fatal smallpox is as great now, as before Jenner's time.
- 4) That smallpox has largely increased during the past few years, in spite of vaccination.
- 5) That serious evils follow vaccination, whether the virus is humanized or bovine.
- 6) That vaccination has never been tested as a prophylactic against smallpox.
- 7) That sanitary conditions and strict isolation of patients, are the only safe guards against all zymotic diseases.
- 8) That the majority of the profession who advocate vaccination are primarily interested in its perpetuation.

CHAPTER 1

THE EVILS OF VACCINATION

DR. C.G.G. NITTINGER'S EVILS OF VACCINATION

Dr. C. Charles Schieferdecker, MD

DR. C.G.G. NITTINGER'S EVILS OF VACCINATION

DEDICATION TO THE PUBLIC

In presenting and recommending the contents of this little volume to the friendly consideration of the public in general, and physicians in particular, I am perfectly aware of the terrible outcry that will be raised against it and me; I also acknowledge the truth that nobody stands there in his time, so perfect and independent, that he would not err and sin with that time. I therefore hope I will be forgiven when I am wrong—may he do better who finds fault with the following. It concerns and aims at the benefit of mankind, and has thus great claim on the consideration of the people. It is a battle against the faith of more than half a century, taught by physicians, upheld by the clergy, and blindly believed in by the people. The odds are fearful; yet truth is mighty. I only ask for fair play. Let the struggle be an open and honest one, not carried on in the sick chamber of the deceived people, or with assassin weapons that shun daylight and the front of the opponent.

I have abstained from the publication of statistical tables, sustaining the contents of this book, and already prepared, but will mention their result.

The increase of the population of the United States of America is immense, but it is certainly not owing to causes that would prove a preeminently increased healthy state of the people, because such increase of population depends on:

- 1) A healthy power of generation.
- 2) A strong desire for generation, and,
- 3) Social furtherance of generation.

When we here cannot complain of a want in these latter two requirements, the absence of the first acts very injuriously, for notwithstanding the large number of births, the existence of a healthy generative power is contradicted:

1) On the part of the male: (a) by the greater mortality of the sex, (1: 29) (b) by the inability of men to bear the fatigues of a campaign, (Mexico) and (c) by the weakness and liability to disease of men in general.

2) On the part of the female:

a) by the greater mortality of the sex, (1: 41),

b) by the increased sufferings during pregnancy, (c) by the frequent premature births,

d) by the more frequently required obstetrical operations, and,

e) by the unhappy experience that the childbed becomes generally a sickbed, and often a deathbed; (formerly the 81st died, now the 23rd).

3) On the part of the child: (a) by the fact that the fruit from such diseased seed and soil comes diseased into the world, (b) that generally 1/2 of the deaths are those of infants, and (c) by the daily increasing number of stillborn children.

C.C. Schieferdecker, MD
Philadelphia, January 1856.

A WORD TO PHYSICIANS

Vaccination belongs not to the "science," it is neither a "remedy" nor even a

"remedium anceps." It rests "a priori" upon ignorance; should everything that happens afterwards in the world, in and on man, belong to Medicine?

My scientific conscience is not so wide. What nobody understands, is for nobody a science. Vaccination is mere "custom." What nobody knows, so much knows every body; in vaccination there are neither wisemen nor laymen, but only vaccine practitioners and vaccine carriers; everybody who has five senses, and perceives the consequences of vaccination, or feels them even on himself, has a perfect right to judge of it. It belongs therefore, more perhaps, than any other object, on the broadest basis of publicity, before that public which offers its skin for it, and lays at stake its welfare and life.

While Medicine slept, vaccination has crept illegally into it; it has borrowed the mask of science, and is neither founded in reason, for poison poisons the healthy, and kills the sickly; nor in nature, for the instinct abhors it; nor in physiology, for then the whole doctrine of resorption and endermaty would be false, it would be (*punctum saliens!*) the victorious autonomy of the life power in the exportation through the skin, an untruth; nor in the chemistry, for even a tyro would not pretend to neutralize acid by acid, alkali by alkali, as the physician, pox by pox; nor in the dignity of man, for who will throw poison about him, against the possibly destructive effect of which he has no antidote ready?

A young country girl told the young student, Jenner, who in playing with her felt her blisters, she would never get the smallpox, because she had the cowpox. More than this tradition has neither the pompous university science, nor anybody else learned of vaccination; and our most eminent physicians and surgeons believe, but do not know more than what that girl has chatted with the student in the cow stable. The constancy in this faith has lasted now some fifty years, and robbed the life's autonomy of its crown, and reason of its right.

Every destructive poison can destroy every organ: the stomach and intestines of one, the urinary organs of another, the chest of a third, the senses and joints of a fourth: we see this in the syphilis, gout, rheumatism, the vegetable and mineral poisons. Where the smallpox poison settles itself, there it produces its disease forms, different according to the different bodies and times. Is it not much more the duty of the medical world to study the pox-matter, and to explain by it the singular conditions of the disease of our times, than merely to laud its assumed benefits, and malignantly scorn at every doubter? Without an accurate knowledge of the organic chemical powers, we are never able to penetrate into

the laws of the life power.

The question: whether smallpox and cowpox are identical, is sufficiently answered in the affirmative by a number of eminent physicians, among which Dr. Ceely of Ailesbury, distinguishes himself; but I add here a letter which speaks unmistakably for itself.

Pruz, Tyrol, October 16, 1850.

"The identity of the vaccina and variola is beyond any doubt established by the fact, that in the year of 1846, every one of the children whom the surgeon F...in the valley of Poznau vaccinated, was attacked by the real smallpox, which infected then the grownup people. F...was much troubled by this unexpected circumstance. Among the people the greatest indignation was roused against vaccination, which has spread all over Tyrol. I, as Imperial Supervising Physician, was often compelled by my official position, to inspect this *artificial* epidemic.

HOCHENBERGER, Imperial Supervising Physician."

Enormous is the ignorance of the vaccinator, and reaches the gigantic height where shame begins; he can break, but not mend the pot. Mightily shines the light of the culture of natural history; first, Astronomy and Physic skinned themselves, then Mineralogy and Chemistry, then Botany got a firm natural basis, and finally Zoology. New forms of thought produced their natural systems; the searching power of the human mind solved first the distant questions, descended from the sun of Copernicus down through the steps of nature, and remained standing finally still before, I say before its own shrine: humanity. Man dislikes nothing more than self-contemplation. Instead of emulating, and not remaining behind the sister sciences, Medicine built thoughtlessly a "*pons asinorum*," with vaccine poison, ostracized for the human family diseases, and existed, arrogantly simpering to this hour, without system. Quackery has lifted its head, builds palaces, and the thermometer and barometer of nations sinks bodily and mentally. Man is not such an unconditional poison plant, as names of diseases the poly-logic medical code enumerates. How many poison springs could he then carry in himself?

More earnest than ever now, when, in consequence of vaccination, the Oriental free pox poison, the cholera, is permitted to slay "ad libitum," rises the medical

sphinx, and asks the old questions:

"What is the nature of the smallpox poison?"

How many poisons may the human body produce? Which are the interior enemies of human life, the germs of suffering and death of the human family here on earth? And in what connection are they with the element from which we live? For whatever contains the laws of joy and life, must also contain those of our pains and death.

Like the wings of a gloomy night butterfly, a rich colored thread draws through the labyrinth of the graves of our ancestors. The symptoms are only the colours, but the nature, the seed of the diseases, is winged DEATH, as he appears in the principal results of rational research, and of dissections of different times and epidemics; as he shows himself to be animal poison, namely, smallpox poison, by chemical analysis to our eyes, and proves himself as such in the practice. Look up from the death history of humanity and see into the blue arch of heaven!

There also, every thing was to go according to the almanac, as before according to the code of disease without sense and plan? No! "*Tempora mutantur, et nos et animalia et plantae et omnis creatura in illis.*" To find out these mutations, to observe and remove the animal poison, is the reform problem.

The vaccination cataract will then be removed from our eyes, and, the gloomy truth overwhelm us, that there is nothing more dangerous for the welfare of men, than a medical optimism; that our bodily sufferings have increased in number and power, that we have by vaccination merely spoiled the form of disease, and made worse the disease itself.

I hope for moral and technical support in this war against the Vaccine Medusa, but fear I will now be traduced and scandalized as before, whenever I have spoken honestly my conviction.

I wish I had, as Pericles of old, the thunder on my tongue, and the lightning in my pen, to rouse the people and science from their lethargic sleep.

Every physician and all the people are very careful with the smaller poisons, of which the lowest are:

1) The mineral poisons: arsenic, antimony, copper, sublimate, vitriol, bismuth, concentrated acids, etc.

2) The vegetable poisons, particularly the narcotic, prussic acid, opium, hyoscyamus, belladonna, stramonium, hemlock toadstool, etc.

By the inoculation of these poisons a la vaccine, in the legs of dogs, cats, of a lamb, in the wings of a pigeon, we are unable to make them seriously ill. I offer my own arm for such experiments, if desired, but I will fight with sword and powder against the inoculation:

3) *Of poisons of living animals, more yet, of their corpses*, (animal poison) f. i., the glanders of horses, the murrain, the saliva of mad dogs, the fresh pox of cows and sheep, the cadaverous pox of the vaccination lancet, etc. These poisons, particularly of animals who suckle their young, are absorbed by the human fluids and textures with wonderful rapidity, and connected with them most tenaciously like rust and iron. The effect is (a) a primary, stormy, and fatal one, or (b) a secondary, lasting, diseasing one. The bite of a mad dog, often hardly perceptible, produces rabies either at once, and is generally fatal; or after 2, 7, 11, 15, 21 years; syphilis will mix, if not entirely eradicated itself, in every act and disease of afterlife.

4) Of human poisons. We avoid every one justly, who has the itch, smallpox, lues, nervous fever, cancer, all contagious diseases in general. We are afraid of the smallest wound in the skin under such circumstances, and know perfectly well the terrible and fatal effects of such impurities, particularly of cadavers.

Consider then the most unfortunate position of a tender infant, that cannot struggle and resist. It is poisoned without regard to the above mentioned circumstances; without regard to season and climate; without regard to the condition of its parents; without regard to poverty and domestic relations; without regard to good or bad care; without regard to teething; without regard to the processes of growth and development of its organs and systems, which are connected with so many irritations in blood and nerves; without regard to the tendency of the infantile body to receive not only readily, external influences of every kind, but also to oppose them violently; without mercy, because the vaccinator understands of what he does, not more than the vaccinated infant; without knowledge of his vaccine matter, for the vaccinator takes what he has,

and gets:

- a) Fresh vaccine lymph.
- b) Cadaverous vaccine lymph.
- c) Pare humanized lymph.
- d) Cadaverous humanized lymph.
- e) Impure, depraved, humanized lymph; namely, such which is taken from children who are diseased from birth.
- f) Cadaverous, humanized, depraved lymph, which is preserved in the vaccine bottle.

Without an idea whether the lymph contains strong or weak poison, delves the vaccinator the lymph he has, into the open wound of the infantile arms.

Pause, O physician! Reflect before you destroy! Your responsibility is terrible. The human body is the temple of God, you are its earthly guardian.

INTRODUCTORY

P. Mabillon tells us, that he who made a valuable present to a cloister, got a box on the ear as a receipt. The greater the value of such a present, the harder was the box. The church gave, therefore, every one who presented a new truth, standing as a spiritual good far above the material, for a receipt, cuffs and boxes, which not infrequently resulted in death. In the same manner, she acknowledged the lighting of far better lights than her common wax candles, with kindling funeral piles. Every one who tells a new truth, may, therefore, very naturally expect to be treated with boxes and cuffs; He, the only one who never said anything but the most sublime truths, received in Jerusalem blows and death.

It is an ominous fact, that the Medical Science was always either entirely arrogated by the priesthood, or, when given into the hands of a distinct class, its followers would find it their interest to league with the priesthood. This will

easily explain why the Medical guild, imitating their older and more experienced confederates, would also seek to hide themselves behind a veil of sanctimonious mystery, and pay every one who dared to touch this veil by truth, with the same coin the church did. "The Science," par excellence, remained jesuitically content, in regard to the people, with the literal explanation of the word, KNOW THYSELF, without being willing to TEACH this knowledge; and even now every public lecturer or writer on matters pertaining to our bodily welfare, is abused and persecuted. This has been my fate ever since I left the old trodden path of scientific mummary, and tried to teach the people simple and wholesome truth by word and deed; it will be my fate doubly now, when I in these pages, expose the criminal guilt of the faculty, in not only not opposing the introduction of vaccination, but in executing it themselves on the innocent offspring of their time.

The physicians cannot now plead ignorance of its ruinous effects, for daily observation shows them to the most painful extent. They cannot excuse themselves, with its legality; for in Spain, the inquisition; in France, the torture; in Germany, the cutting off of hands, and tearing out of tongues; and here in America, the burning of witches was also lawful! And yet, they all have fallen into the dismal abyss of execration in their flight before enlightened reason!

The non-use of reason in the Medical Science, is the cause of its want in positive progress. The present sheet anchors of the practice—venesection, leeches, vomitives, purgatives, iodine, quicksilver—do they satisfy real science? Or are they able to exorcise death? Why, then, the continued fruitless hunting for new and absurd remedies, even of the most disgusting character, namely liver oil, guano, urea?

Why do even physicians resort to quack nostrums, or to such most ridiculous hallucinations as that of Hunter's inhalations of vitiated air in consumption? No science has yet been degraded by its own vagaries so deeply as the Medical.

Every science develops itself in three periods: the first is that of blind faith; the second, that of smart sophistication; and the third, that of sober investigation. The religious period of science, for instance, in regard to the treatment of smallpox in later times, was vaccination; the sophistic period, revaccination scar theory, and a vaccine table system. Let us now solve the last problem; for as long as we renounce experience which creates knowledge we banish real science, (Liebig) and favor the ascendancy of every trumpet humbug.

The object of this pamphlet, is to prove vaccination to be nonsense before reason—a miserable illusion, in a scientific point of view, and, in regard to history, the greatest crime that has been committed in this last century. The truth of these positions I have asserted these last fifteen years, and wherever I could, I have saved infants from this cruel poisoning; but I felt myself so alone already, on account of my curative views, that I would not write on the subject, because I could hardly expect that any good would come from my single handed protest. But what I have felt, and what I have preached for years, now shakes with thunder sounds the proud walls of senseless self-sufficiency and lethargic routine. In the heart of Europe, a great and good man, Dr. Nittinger, regardless of abuse and malice, has told in mighty words the truth:

"By vaccination, humanity has progressively lost:

a) in number,

b) in quality and life duration—the diseases have gained in number, power and,

c) tenacity; "and while in humble gratitude I pray to the Almighty to speed his work, I have translated, extracted and adapted his book for publication in this country. May the faculties of this country, like those of France and Germany, as well as all the laymen, ponder well over its hints; and may the work thus begun in this country, be continued and finished by abler hands than mine.

Meanwhile, I beg every parent who is requested by a physician to have his child vaccinated, to put to him the following questions:

1. Do you know the nature of the smallpox poison? (No!)

2. Do you know the nature of the vaccine poison? (No!)

3. Do you know how, in vaccination, both work upon and against each other? (No!)

4. Can you deny that vaccinating is poisoning? And excuse it because destruction does not always follow a senseless method?

5. Have you got sure remedies against the smallpox? And if you have poisoned

my child—against the vaccine poison? Or will you satisfy me with the consolation, that kind Nature will often bear and conquer the most terrible consequences of the most senseless treatment?

6. Every tradesman knows his tools, materials and rules—have you a criterion for vaccination?

7. And what nobody knows, you call method? Science? Or even archaic physiology?

8. Can you deny, that not every agent produces in every man the same effect?

9. Can you tell me, why whole countries have, without vaccination, remained free from smallpox epidemics?

10. Can you deny that, since 1846, the smallpox epidemic progresses incessantly? Has vaccination held back the smallpox even a hair's breadth? Have you any other remedy to oppose that scourge with, but the deceptive one now in use? Or do you believe, that on the Bank of Disease and Death, a paper—the receipt for a vaccination fee—will be received for full payment?

11. Is, in the history of mankind, vaccination the only and isolated case, that a whole century or a nation has believed, judged and undertaken things, which we do not believe, judge quite differently and never undertake?

12. Can you deny that absurdity reigns without logic? And that many a victim has appeared before God's throne without his time having run out?

CC. Shieferdecker, MD

THE EVILS OF VACCINATION

§ 1. The flourishing condition of a country depends principally on the number and well being of its inhabitants. Whatever decreases these, is an enemy. The greatest mischief has been done by sanguinary wars and epidemic diseases; to take precautionary measures against these hostile interferences in the happy progress of nations, is the duty of governments and individuals, and requires

prudence, power and courage.

In our exciting times, when the peace tired people call everywhere for warlike preparations, the medical staff should also arouse themselves from their lethargy for a struggle with the sneakingly spreading enemy of the internal and external smallpox which, as I intend to show below, is the source of most of our misfortunes. The bloody wars, the most fatal epidemics, have never caused such dreadful devastations among nations, as the smallpox, when we consider that formerly, this disease slaughtered in Europe, yearly, near half a million of victims. Is it to be wondered at, then, when the layman, who only with difficulty conquers his instinctive aversion against vaccination, looks anxiously at the effects around him, where smallpox cases are daily increasing; when he begins to distrust the preventive, which has deceived him once, and deceives him again in the revaccination; more yet, when under the eyes of the observing physician, the poison in its first stages, in its germ, growth and bloom, diseases whole families, and now every where clearly approaches the time of harvest?

Not the smallpox, appearing in proper form on the surface, is now to be feared; but the matter, that disturbs, paralyzes and destroys the inner and higher organs, which, without developing its power outwardly, remains in our interior shut up, is the most dangerous enemy. A man looks well, and is apparently healthy, but the poison has penetrated his vitals, and insidiously undermined the supports and organs of life, till its fruits are ripe, and death reaps the harvest. Should not, under such circumstances, the physician be startled up from his easy couch of inherited faith on the preventive power of vaccination?

Should he not, free from authorities and oracles, scrutinize more thoroughly the history of Medicine, and dive deeper into Nature and her work, in order to gain, in the extraordinary presence, that knowledge and direction, for which he can answer in the future before science and those who honour him with the most sacred trust? Faith is not Science.

§ 2. I know I have to travel a hard road! It leads me among the Pietists and Fanatics of Medicine; and the clamour against him who condemns the sacred institute of Vaccination, will be like the roaring of those who defend the faith on other mystical fallacies. I feel, like Sarcone, that I am a physician and a man. The difficulties of art, and the limits of the human mind, circumscribe me. But, whatever may be the consequence, I shall be happy, if I have marked the first lines for the work of medical liberation, which others may and will finish. Every

hint at a new truth in the healing art, is a benefit for the human family!

To proscribe and to prevent Vaccination, is the object of these pages. For this object, I propose to prove, in the shortest possible manner, the truth of the following three conclusions:

I. Vaccination appears before the tribunal of Reason as Nonsense!

II. Vaccination shows itself in the light of Science, as a MISERABLE ILLUSION!

III. Vaccination proves itself, in the history of humanity, to be the greatest crime committed in this last century!

CHAPTER 2

FIRST THESIS: VACCINATION BEFORE THE TRIBUNAL OF REASON

§ 3. To restore order and equilibrium, power was always counterpoised by power, courage by courage, prudence by prudence, overweight by counterweight, and everybody understood, why one poison should be annihilated by a counter poison—an antidote. In our century a new idea, entirely unique, sprang up. Nobody knew an antidote against the smallpox; but the poisoned lancet was thrown into the scale of life, sunken with smallpox poison, and vanity triumphantly glorified the act. Pox poison must drive out pox poison; Satan must drive out Satan!

The pure human being, free from diseased matter, the innocent infant, is poisoned and consoled with the Mephistophelic declaration: "Now, it will certainly not get the smallpox!"

The unfortunate being, who has already the poison in his body, receives more of the same poison, and is taught the arithmetic of witches, and told that "twice one is none," and that the poison of the body is somehow or other swallowed and "digested" (Dr. Heime) by the poison of the lancet. This miraculous thing, which does not make unclean the clean, nor cleanses the unclean; which is a poison, and yet protects both from its own effect—this miraculous thing, which acts almightily in every period of evolution and involution, in the infant as in the adult, in the woman as in the man, in the weak, scrofulous constitution, as in the iron one, and in every part of the world—this miraculous thing is a "protective poison," like Moloch, a God in whose arms the infant suffers, sickens and dies.

Of this universal healing wonder of mankind, we do not yet know any but injurious and fatal effects! Its most celebrated friends could not help but to acknowledge this; and we bless yet a poison as a remedial agent which we sow in joyful faith to weep rationally over the damage done by it. We flee before syphilis and avoid the itch; and yet their contagious principle in its innermost nature, is a near kin to the smallpox, with the only difference, that the last is far more destructive than the former. If the strongest poison—that of the smallpox—

protects from smallpox, then, without appearing paradoxical, syphilis must protect from syphilis, itch from itch, plague from plague; and its inoculation should be insisted upon in all well regulated communities. Pidgeons, inoculated on the breast, get the most beautiful vaccine pustules, syphilitic and itch ulcers. Why should we, then, be so onesided and partial with the vaccine?

§ 4. Like the odor of musk, and the color of cochineal, the smallpox poison divides itself wonderfully; penetrates everywhere; clings to everything—to clothes, furniture, beds, walls, domestic animals, to everything on which the exhalation can fasten itself; neither air nor time destroys it. This poison, then, whose atomically smallest quantity, for which even a Homeopathist could not find a number, which the governments try to keep off by police measures of the strictest character, must, according to law, be incorporated in the delicate inner economy of the human body, even of the tender infant; and this, not Homoeopathically, but the full fresh matter, the more the better for the well-being of the human family! A merely cursory look into history, shows us that Leprosy came to an end; afterwards the Plague also; Syphilis lost its epidemic character, etc. Have human exertions done this? Or does, in the nature of these evils, also lie the foundation and duration of their existence? And has everything its time?

How shall I comprehend that, like those contagious diseases, the smallpox will also dissolve itself and disappear, if the poison is kept in the body artificially, as a standing article, by continued inoculation.

Let us suppose that the cowpox lymph be, what it is certainly not, a perfectly harmless matter, for the reception of which we in fun reach out our arms: who can give us security, that in vaccination and revaccination, no other diseased matters are introduced into our bodies? But as the vaccine poison is, was, and will remain, from its first origin, nothing else hut a poison of a narcotic character, which, in its divisibility, exceeds even prussic acid, must we then not ask, whether we, under all circumstances, can bring it into our body with impunity?

In regard to the smaller poisons: itch, syphilis, nervous fever, cancer, the public and physicians are very careful with a little cut, the least scratch, the bite of a leech, a plaster, and particularly with the lancet for venesection, because everybody knows the terrible consequences from any such neglect; experience teaches, "that if a lancet besmeared with matter fresh out of a smallpox pustule is

immersed into a vein, the same effect is produced, as when the smallpox poison is brought into inner organs."

The symptoms of vaccination are those of intoxication, often similar to those of poisoned wounds: fever, vomiting, diarrhoea, swelling of glands, vehement local inflammation, etc. Nature clearly expresses her indignation against the unnatural intrusion. In the face of such experience, and against the conclusions of my own reason, I am asked to have faith, and to be content, in the simplicity of my heart, with this paradox:

"Small poisons, brought in the least scratch, are injurious; they poison, and must be carefully avoided; but the greatest of our poisons, brought into the body by 6, 8, 12, 18 lancet cuts, are not only not injurious, but they cannot do any harm, they never have done, and they never will do harm; this faith is the faith of the country, and must not be attacked by the conclusions of miserable reason. To call the excitement of the body, after vaccination, a violent indignation of nature, is wicked: it is the incomprehensible act of transubstantiation, in which the bodily poison is swallowed and digested by the lancet poison, and man rises out of such digestion purified from the smallpox poison."

This is one of those theories, of which Goethe says that they are grey, and Hamlet that they are not true. If I would assume that a rational being or government intended to poison first everybody, in order to cure them afterwards, all the world would call me mad; and yet governments order every year thousands of people to be poisoned by smallpox poisons, and are in ecstasies about the progress and blessings of art. Nobody calls this madness!

CHAPTER 3

SECOND THESIS: VACCINATION BEFORE THE TRIBUNAL OF TRUTH

§ 5. Have we gained or lost by vaccination? Should we continue to vaccinate and be vaccinated?

In the large cities of the United States of America, and all over the old settled parts of this country, an unvaccinated person is of seldom occurrence; but we find a great many who have been two, three, four and five times vaccinated. Should we then not rightly expect that this country, before all others, should distinguish itself by the remarkable healthiness of its younger generation, and that it should shine a beacon light for those millions who either vaccinate not at all, or at least very carelessly? How ashamed those stupid barbarians must be! How beautiful in growth and face the wise American—and how misinformed, pockmarked, wasted, sickly the Greek, the Oriental, the Mexican, and all barbarians must be, who do not immolate themselves and their children to vaccination? The fatigues of a campaign, the exposure to deprivation in the wilderness, and in the common life scramble of social relations, should not leave an impression on such youthful heroes of art, while those, who laugh at vaccination, are so able to bear already so much!

But is this so? The unfortunate remaining few of the soldiers that went to Mexico, tell a terrible tale of the contrary! While the vaccinated English and French in the Crimea, are decimated by the smallest exposure, the unvaccinated Turks and Russians bear up under the same circumstances with great elastic tenacity! While in Africa, the source of the smallpox, some die of it, we are thinned by the terrible consequences of vaccination: smallpox, itch, typhus, and every kind of pustule diseases, many of which were entirely unknown, before vaccination came in use.

There is a happy configuration and management of the soil here; the population is not densely packed as in other countries; we do not live under the pressure of poverty, of famine, or other particular calamities: there was no war in our midst, and the Mexican campaign was not an exhausting one; we enjoy liberty;

marriages do not find obstacles: thus, every favorable element concurs for a prosperous physical progress; and yet we have not gained in a healthy development of the body, but we have clearly lost. Every new generation hastens forwards to bodily destruction, as if a worm was secretly gnawing at the root of life. This worm is the smallpox poison: the genuine as well as the inoculated vaccine. Its existence, without external pustule, is proved by chemistry; and its removal out of the reach of the human organization, not its increase, is asked from true science. Art should remove it by scientific care; Nature ejects it by pustular and other eruptions.

It is truly a pity, that at present few only bring their poison to the surface, and thus have a short struggle, which is remunerated by durable health afterwards. The life process of the fluids and of the nervous system, is so much interfered with and weakened by the steady working of the poisoning method of vaccination, that a great many of the people have become too miserably feeble to drive the tough smallpox poison out of the system. The poison continues to be produced in the hearth of digestion; uninterrupted by scientific interference, it remains in the interior organs, paralyzes and undermines the whole machinery of the human organism, appears to the superficial observer, in various forms of diseases of the sensibility, as well as of the irritability, reproduction, secretion, and propulsion. The same poison produces in different organs and systems, in different bodies, families, nations, and zones, different effects, but gives always the diseases, particularly those of children, a malignant character. This is the absolutely sole and satanic protection, vaccination ever offers.

§ 6. "But," says Professor Dr. von Rapp, "You charge vaccination with various injurious effects, which cannot properly be imputed to it. The diseases which you attribute to vaccination, have already existed long before; or, if they are only now more accurately distinguished, they ought not to be derived from vaccination!"

I assert, and am ready to prove, that the smallpox poison and the vaccine poison are identical. As long as this fact is not clearly refuted, and as long as it is not proved that both of these poisons are of an essentially different nature, so that the one can serve as the antidote of the other, so long is it indifferent how much of injury in a disease is to be attributed to one or the other. They both together do injury, only that, in the one case, the injury is a natural struggle for health, while in the other, of vaccination, the injury is a culpable act of man. The variety of injury is far greater and more extensive than above mentioned, for it is infinite,

incalculable. There is not one medicinal poison that has only one effect, and the vaccine poison would alone be an exception!

If we, for instance, look at the multifarious effects of tartar emetic in different doses: pustules, other eruptions, nausea, sickness, pain in the stomach, vomiting, diarrhoea, cholera, perforation of the stomach and intestines, colic, inflammations and paralysis, gangrene, affections of the nerves, muscular weakness, suffering in the breast and head, disturbances of the senses and mind, palpitation, asthma, congestions, hemorrhage, fever, etc., if we consider the legion of symptoms produced by a narcotic, should we then believe that the most subtle poison which exists under the sun, the most powerful poison that tyrannizes the whole earth, would NOT possess the greatest power and multiplicity of effect?

"Very well, but all those diseases you impute to vaccination, have existed before," etc.

The forms, I will grant, have existed; the construction of the human organism does not change; the nature of diseases remains always the same, and the necessary crises follow always the same laws. Every difference we see, consists only in the different reflexes. There were, and will always be, different kinds of vomiting, without tartar emetic. Unfortunately, there are many pathologists who will treat diseases according to their symptoms, as Linne the plants, after their filaments. In the attempt at the removal of human miseries, it is most important to look for their seed, their origin. He who says:

Fire is fire, lies under a mistake! For wood, oil, pitch, alcohol fire, each of them requires a different means for extinction, yet fire existed always, but not the knowledge of its nature, its seed and origin. He who pours water on burning oil, commits no greater wrong than the physician who treats diseases by system only, their foundation may be the smallpox poison or not. The most simple disturbance of the stomach, produced by this poison, can thus be driven into the most violent nervous fever, in consumption. Can we then console ourselves with the reflection, that nervous fevers and consumptions have existed before? The forms have existed, and will remain the same, but the causes change, and determine the weal and the woe of the end, and the manner of the active interference of the physician.

Where the effects of tartar emetic are visible, there we have a tartar emetic

disease before us, be it inflammation, spasms, cholera, or pustules: should we here, although these disease forms have existed before, and although these forms have been successfully treated with tartar emetic and ipecac, again prescribe tartar emetic? Most assuredly not! And precisely so it is with the smallpox! Wherever in a disease form the smallpox poison is active and visible, or only discernible by the symptoms, there we have a smallpox disease before us, be it pustules, gastro-malaria, croup, whooping cough, cholera, spinal affection, consumption, etc. As little as we would cure vomiting, as above said, with tartar emetic, we would pretend to cure smallpox with smallpox, or with things that have affinities with the smallpox, namely: whey, milk, beer, bad potatoes, and such things.

Every contagious disease must continue to exist, although time may change its form even, till the remedy is found for its destruction: its momentary disappearance is not more than an optical delusion of the mind. I therefore must certainly acknowledge, that sufferings arising from smallpox poison have always existed, but that is the very reason why we ought to be constantly on the lookout for it.

Since the more general introduction of vaccination among the people, diseases have slowly increased; for we find on the Elysian fields of Pathology, besides the old and current diseases, a crop of other diseases springing up, partly entirely new, partly the usual ones with malignant character and unusual tenacity—all of which have clearly their foundation in the smallpox poison, and require quite a different cure method.

The following is a rapid glance at the pitiable acquisition of our century, which may produce at least one good effect: "that it will lead to reform in Medicine, and call the attention of observers and thinkers to an examination of the immense area, the smallpox poison now occupies:

1. Diseases of the Sensibility

The English, who have brought vaccination into existence, have felt their blunder first in its progressive destruction; they always precede us warningly with the punishment of terrible scourges, like angina, croup, typhus, softening of the stomach, putrid fever, cholera, and of other internal smallpox forms. And we? Of course, we follow!

About fifty years after the first vaccination in England, Dr. Home complains:

"That the formerly more frequent inflammatory diseases have decreased, but that the number of those of an opposite character have immensely increased. The first, of which Sydenham speaks so much, do not at all exist in London any more; and in Edinburg there is hardly seen a right strong inflammatory fever. The lingering putrid, or nervous fever, (typhus nervosus) is most common; and what is particularly remarkable, this slow fever attacks principally persons of an age which is generally most prone to strong inflammatory diseases, namely, the years from 18 to 30. This increase of such debility fevers is clearly the consequence of the fact, that the people are getting every day less vigorous and weaker in general, etc."

Everywhere, where vaccination was introduced, the same unhappy state of the human organism became visible; and the longer and the more extensively people indulged in this luxury, the clearer began physicians to write on typhus, which follows vaccination like its shadow, from place to place, from station to station. A general weakness of the muscles and nerves is thrown over all the people that worship the Moloch of vaccination. The slightest affection, if not very tenderly touched, takes soon a nervous turn, gets gangrenous, and laughs the physician in the face. It is most painful to observe the continued increase of spinal irritations, curvatures of the spine, palsies, chronic nervous sufferings, insanity, melancholy, suicide, mental debility and softening of the brain, apoplexy, hypochondry, hystery, dizziness, cramps, neuralgias, ischias, tic, nervous headache, disturbances of the senses, amaurose, hard hearing, general weakness, want of reaction in diseases, loss of sleep, etc.

2. Diseases of the Irritability

Sensibility and Irritability are fellows! Therefore, weakness of muscles, particularly of the involuntary, which stand near the inner life—trembling, rheumatic, gouty, stiff, contracted, useless members, pains in hip and back, swellings of the bones, caries, etc.

3. Diseases of the Reproduction

The stomach! The stomach! And always the stomach! Yet once more! The

stomach plays the part of the hero in this present drama. The digestion is miserable, I would rather call it hysterical. Phlegm, acidity, bitterness, heartburn, flatulence, worms, carrion stools, bad urine, constipation, diarrhoea, pressure, cramp, vomiting, softening of the stomach, dysentery, typhus (smallpox of the intestines) cholera, a pitiable condition of the sexual organs in males and females, queer appetite and sleep—all these exist and alternate with each other in Babylonian mixture.

4. Diseases of the Secretion

The spleen suffers preeminently, and reminds us of the diseased condition of the milt in domestic animals; next, the liver and other glands, particularly the mucous preparing glands of the inner coating, in consequence of which, whooping cough, croup, hectic consumption, influenza, scrofula, dropsy, chlorosis and scorbut, are so frequent. The itch has emancipated itself from the "scientific itch-mite" syphilis seems to assume again the exanthematic character. Both show an immense number of infected victims; both like the company of the smallpox poison; and all three give away to the same remedies. The skin, in fortunate cases, breaks out in many sharp eruptions, namely, pustules, papulae, tetter, exanthems, furuncles; the miserable urinary organs help themselves sometimes by urinous, the intestines by haemorrhoidal discharges, of a certain degree of heat and acidity.

5. Diseases of Propulsion

The human heart shows itself here most clearly as the organ of feelings. Happiness, joy, pleasure, emotion, affection, passion, inclination, longing, have lost their poetical rose color; a more dark, melancholic tendency has entered the chambers of life. In the same manner, as the stomach does its unpleasant socage service, does the heart its duty of driving on the blood circulation, with reluctance and difficulty. The blood has become blue-black, weak and thin; the serum greenish; bleedings are frequent; there is an inclination to mortification, passive congestions, palpitations, piles; all fevers and momentary symptoms change quickly, and the corpses turn soon blue and putrid.

§ 8. All these disturbances in the happy, healthy, lively interchanges between the organs of man, have existed and will exist. But as the bite of a good or bad dog, is to be judged, not according to external aspect, but according to the tooth that

did bite: we must also in diseases of our times recognize the mask of a poison, which spreads desolation, sickliness, misery, pains, tears, and often premature death among the people. The fresh and blooming grave of the virgin, the noble courage and strength of the young man, wither away under its secret influence. Often do we see a young corpse, but not the fatal weapon! Call it the genuine, or the vaccine poison—enough! It is in various ways the pox poison. Such misery is prevented, when Nature or Art succeed in throwing the poison from the interior to the surface;* and this most radically, in its true original form as smallpox, or in bastard form of any other matter expulsion.

*As most signally in the case of Mrs. J. L here in Philadelphia, by the breaking out of a most violent attack of smallpox, and in very many other cases I had here in my hands. —Dr. S.

The strength of the body used up in the sirocco of fever, is seldom able to drive the matter out by urine, sweat or in hemorrhoidal crises. Nature generally and tyrannically calls for pus. Nature is in smallpox fully satisfied with suppuration, and blooms afterwards only the more beautifully. The bastard forms: pustules, itchy and tettery eruption, boils, furuncles, gum boils, suppurated, glands, sore fingers and feet, appear often as after crises, the favorable influence of which, for health, ought to be higher valued than it is. Nature does not higgler with herself; she punishes, when it is done with the above mentioned ills, for the natural law revenges itself by natural punishment.

Well then! Will we rouse Nature further yet to rebellion, by vaccination? "Will we further defy her clearly announced law? Let it be granted for a moment that we could do it, while we really cannot do it: would we then be irresolute in the choice between a mark in the face, and a deep drought of the sufferings of life? A silly girl might, perhaps, fear the small evil, because she sees it, and choose

for it thousand times greater ones, which she sees not and knows not. But should the physician immolate at the altar of cosmetics, the happiness of life and families?

The present mode of treatment, and the progress of medicine in this respect, lessens the fear of disfiguration very much; the method of shutting the patient up in hot beds and rooms with his disease exhalations—of letting his dry lips languish for water, and his burning, parched skin bake in fever, is forgotten, and has made room for a more rational, cooling treatment, by means of which an intelligent physician can prevent almost, if not quite entirely, the disfiguring effect of the disease. But so long as the Chinese write with their present signs, so long is their progress impossible; and therefore, give the physician a different education. Be not mystified yourself by illegible signs and unintelligible sounds.

§ 9. Our present population give us the best opportunity for drawing comparisons in regard to the influence of Vaccination. We can divide our fellow beings into three classes:

1. In those of from 1 to 25 years of age; nearly all vaccinated, and many revaccinated.
2. In those of from 25 to 50 years of age; born here, and mostly vaccinated, and some revaccinated; and,
3. In those of from 50 to 80 years of age, not at all vaccinated in childhood.

Let us now compare the last class with the first and second. Justice is the basis of society. The people of this third class can and shall sift the present and the past, solve doubts, clear up darkness, and honour truth, whether their children and grandchildren have gained or lost on strength, fullness and well being of life, by Vaccination. And truly, our seniors, who have lived and acted so infinitely more than we—who have seen and fought the battles of freedom, and cultivated the wilderness, while we always enjoyed the blessings of peace and plenty—our seniors, I say, stand like strong oaks before as; they hardly know anything about nerves, spine, stomach, nothing of mucous diseases, nor of interior ulcerations. The grandfather sighs with feelings of pity and contempt:

"What miserable fellows our descendants are; each of them requires more of medical attendance in one year, than I had in my whole life!"

He digests yet with ease; is not oppressed by his meals; his ideas are clear and flowing; he is in the full enjoyment of his well preserved body for all functions, and his head performs readily its duties; he has not squandered his money for medical quackery, and enjoys contentedly the means which his exertions and fortune have accumulated around him. The matron who has for twenty years or more fulfilled domestic duties, and who has borne, probably, many a severe trial—look at her, how well preserved she is; how actively, cheerfully and healthily she moves about—she is perplexed at things she cannot understand. She must buy for one daughter false hair; for another she has to cook something particular, her stomach being so very delicate; her granddaughter she has to take to the country, on account of weakness and a troublesome cough; another grandchild she has to give cod liver oil for glandular difficulties; a third has a swollen goitre-neck; and a fourth has to be brought to the dentist; and let us sing a loud hosannah for the vaccine lancet! The fifth must be sent to an Orthopedic Institute. The poor old lady is puzzled about this new name; she cannot pronounce it!

What a perverted world! The old are strong, the young weak: the old nurse the young! All you aged people attest, whether the scale of domestic happiness has sunk or risen, since Vaccination has become general. Speak you, aged pastors of the land, whether joy or premature suffering has grown in your folds? Say whether you hear yet in your temples the same clear sound of voices you heard formerly!

Whether you see yet the healthy, ruddy faces, you admired in your youth, around you! You older teachers of schools bear witness whether there are more docile and healthy children, or more pale, weak, scrofulous, tettery, itchy, coughing ones now, than thirty or forty years ago! Tell me, physiologist, wherefrom comes the smaller stature of the people? The less marked formation of muscle and development? The miserable condition of the mouth? The languid expression of the physiognomy? The green, yellowish hue of the face? The lower degree of warmth of the body? And, finally, let us call on the servants to testify of the horrible excretions of the body—of the disgusting sweats in bed—of the loathsome condition of the body linen—of the stench of chamber vessels—of the decided carrion smell of the clothes often in the cleanest and best families.

Speak, then, parents, priests, teachers, physiologists, servants! Your observations and conclusions will undoubtedly coincide in one point: that there must be at the

foundation of this internal and external corruption of the people, a common cause, a cause of destructive effect. Let us consider our fair land a garden, and its inhabitants the plants of this garden: Is all in this garden in order, perfection and splendor? If this is not the case—has, perhaps, the gardener a wrong method, or the root of the plants the worm? Or do, perhaps, both causes exist? Is it the unnaturally inoculated, and the natural smallpox! Let the moralist think of this. Let the heartbroken mother answer thus the bitter sighs and the humble questions she sends with tearful eye up to heaven: why her darling thrives not? why it suffers so much? And why it is taken from her? Do not consult in this great question, of the weal and woe of our blessed land, the dim lights of University-liliputs, the jargon of arrogance, the self-complacency of scientific stupidities. A few instances do not prove a generality, and blasphemy cannot hold it up! The free eye looks its age into the eye, and judges the whole from above!

§ 10. Shall we have, then, the fearful smallpox again? Shall we, perhaps, venerate it as a benefit? By no means! But before I qualify my answer, tell me, my friend, "Where has the smallpox been these last fifty years? That is, the smallpox you fear so much; we will call it the historical smallpox?"

"The malignant smallpox of the 16th, 17th and 18th century, which made its appearance in so murderous a manner, often even with all the terrors of the bubo plague, and against which medication did nothing—where was it in this half of our century?"

Has it, perchance, been kept and preserved among those who were not vaccinated; perhaps, where the seed and root of the smallpox grew?

No! Nowhere on the whole earth! Let us examine the principal years of terror of the last three centuries. They are:

1. **For the whole earth:** 1586, 1723.

2. **For America:**

Mexico; Hispaniola. 1518.

South America. 1728, 1750.

North America. 1717, 1738.

Hudson Bay. 1781.

3. **For Africa:** Cap. 1755.

4. For Europe:

A) North:

Russia. 1580, 1605.
Faroe Islands. 1651.
Iceland. 1707.
England. 1660-1692, 1729-1740, 1752, 1765.
Holland. 1562-1563, 1636, 1666.

B) South:

France. 1541, 1568, 1577, 1666, 1693, 1741-1745.
Italy. 1551, 1567, 1717-1725, 1753-1755.
Switzerland. 1626, 1686, 1697, 1735, 1746.
Spain. 1517, 1529, 1564, 1648-1851.

C) Middle:

Germany and Hungary. 1519, 1530, 1542.
1552, 1624-1629, 1633, 1657, 1666,
1678-1679, 1689, 1696-1697, 1700,
1706, 1711-1714, 1715-1717, 1758.
1778, 1798, 1801, 1805.

At the beginning of the nineteenth century, the historical smallpox leaves us suddenly. The Earth, vaccinated or not vaccinated, did not yet see in these last 50 years a time like the above mentioned.

Did the murderer of millions run before a woman—Lady Montagu—who, in 1722, came from the land of the former paradise bringing a modern Eva, in stockings—Inoculation—for an Adam's apple along to England? Or did the scourge fly before the vaccinating lancet of the German Plett, 1790, or of the more scribbling Jenner, to whom a milking country wench offered the apple of temptation? Prove to me the existence of the historical smallpox at this time; and I will not yet believe in vaccination, but I will not scold and condemn it. But, surely, smallpox was gone! Did not exist any more! Long before vaccination was introduced! For, although on the 28th of May, 1799, the first child got vaccinated

in Germany, the system was not generally introduced before 1820; and long before this year the historical smallpox had disappeared! Without waiting for medical experiments and government ordinances, the disease changed its terrible character into a better one, and showed itself only sporadically.

Dr. Elsasser reports, that from 1808 to 1810, only a few cases of smallpox had been observed, and that in the kingdom of Wurtemberg, during those terrible years of war and famine, from 1813 to 1817, only 2,385 cases made their appearance, of which not one was malignant.

Schnurrer says, in 1816:

"This year's smallpox is more identical with the regular old disease, than that of the two preceding years; there was the specific smell wanting, and the third stage, where the eruption loses the red circle, and stands like wax drops on the skin; the contents run out, or were resorbed, and did not form the usual scab."

The same eminent physician remarks, in his Chronicle of Epidemics, (II. p.290:)
"The view that the smallpox, without vaccination, would have become by and by milder, and finally disappeared, gains strength by the observations made in the years 1816, 1817."

The central vaccine physician, Dr. Seeger, of Stuttgart, writes, "that Wurtemberg remained from 1818 to 1824 entirely exempt from smallpox, and that from 1825 to 1830 there were so few cases, and these so light, that it was hardly worth while to speak of it."

He cites then Vezin, who says, "that the frequent cases of varioles and varioloids are not the consequence of the temporary protection of vaccination, but that smallpox epidemics appear only in certain longer intervals; and that in the first thirty years of this century, the smallpox would not have epidemically broken out without vaccination."

Let us farther hear the classical authors on smallpox, the learned Lentin, and the penetrating Sarrone:

"Much foundation as the opinion of those may have, who believe, to be able to mitigate, to improve, and, as it were, to dilute the malignity of the natural smallpox, by repeated vaccinations, the observation will always stare in their

face, that when one who is vaccinated, is exposed to natural infection, the disease will always appear in its true form, and mostly with a malignant character." *

*The truth of this assertion is proved by daily experience. I myself have been, in my younger years, repeatedly vaccinated; and as soon as I with my elastic constitution was exposed to infection, I got a very severe attack of continent malignant smallpox, which infected again my whole vaccinated household. — Dr. S.

Although we have had, in later years, in spite of the general introduction of vaccination, a great deal of smallpox among us, the real old historical smallpox did not appear. Where then is this Medusa? She is not here! Has she perhaps hidden herself in your interior? She is not among about 250 millions thoroughly civilized men!

Perchance you find her among your 600 millions other fellow inhabitants of this earth, who know nothing of a Lady Montagu and her inoculation epistles, nothing of Jenner and his country wench, nothing at all of vaccination! No! She is not there either! And, more wonderful yet, think only! These unvaccinated barbarians have and have had no smallpox; they live and exist happier than you, who suffer from an avalanche of internal miseries: you who are a weakling, notwithstanding you are vaccinated "*secundum artem*!"

Not even the Indians of Quito have the smallpox any longer, (for Humboldt would certainly have mentioned the fact) although Hoffman tells us that they suffered formerly from the most malignant kind. Now, think yourself a collection of faces and bodies of all countries and nations, accurately painted, regarding color, features and formation: what a field for reflection and investigation on vaccination and un-vaccination! The result of such meditations give us the true wisdom about vaccination. The whole vaccination witchcraft is as great and infamous a lie as the infallibility of the Pope, in which likewise millions have faith; they die for their lie, while we vaccine worshippers perish on ours!

Vaccination has not protected us; it could not do it, because the smallpox had already left us and the unvaccinated world, before its introduction, or, as I will presently show, had taken another turn; it will not protect us, but rather lead us deeper and more steadily in their arms. The great Sarrone says:

"We have observed, after many a vaccination, that the infection spreads by this very means, when we expected it the least!"

To what Fernelius says already, in the sixteenth century:

"It is true, we are many years, in succession, free from the inroads of smallpox, but we often have found, ourselves unexpectedly attacked, and nearly destroyed!"

We have to subscribe, this very day, our bloody signature, while we must recognize the apparent modification of the external form, for a miserable illusion, when we find this vaunted modification existing in a transfer of the disease from the exterior to the interior life organs.

CHAPTER 4

THIRD THESIS: VACCINATION IS A CRIME

§ 11. Our actions are generally based upon three motives:

1. Upon faith (blind belief).
2. Upon habit (false experience).
3. Upon knowledge (true experience).

Every other motive, as passion, etc., we exclude here at once. We must acknowledge, that we are wanting the preceding necessary insight into the effects and consequences of vaccination, and that we therefore cannot give a rational account of it, and continue its application, as a mere senseless habit, as long as we cannot refute the truth of the following positions:

1. The cause and the nature of the smallpox poison and of the smallpox is not known.

Vaccination is the apocalypses of medicine. Claireau says:

"Laws are, in the widest signification, the necessary conditions and relations of things, which flow from their very nature and in this all existence has its own laws: God and the material world of bodies—the spiritual and animal creation—all have their laws!"

Vaccination is not founded upon any law of nature; it is truly an outlaw!

2. It is the same with the vaccine or cowpox! We know of it not more than what that country girl told the youthful student Jenner. Jenner believed it in the true English fashion; he told it farther; and physicians, laymen, kings and nations, plunged wildly and blindly in the same faith, which soon became so authoritative and unconditional, that every doubter was treated with contempt and excommunication, and persecution.

The faithfully believing people soon mixed the thing with the person, and accorded to physicians the ability of moving the powers of nature after their own

pleasure, and created thus a larger and farther privilege for the medical profession. The excessive veneration for this institute, was richly nourished by the timid thought on the terrible smallpox, which was looked upon as the most horrible scourge the human family had been subjected to.

Impudence and self-complacency copulated with it a thought of divine origin and unavoidable necessity. Notwithstanding all this, we physicians do, in reality, know nothing more about the cowpox, than what the tempting country Eva has told her admiring Jenner. *Ea judex est ante ministerium mortis.*

3. Of the effect of the cowpox or vaccination, we only know, that man and cow get sick and suffer from it. It produces clearly all the symptoms of a most thorough poisoning. Astrology is the moral disease and weakness of the Orient; the vaccination faith that of the Occident. There are in the Occident, as well as in the Orient, blind gropers, who act without knowledge of cause and effect.

4. How the cowpox poison should insure man, we cannot even dream, far less physiologically think. When the believers of Metempsychosis, the Tartars, swallow pills made of the excrements of their high priests—as Forster and Hastings testify—the filthy usage rests upon a deep thought, upon an idea—but the vaccination?

5. The medical science has no power over the smallpox poison; it is confined to the defence! If we had a clear insight into the effect of the lancet, and would remain silent about its destructiveness, we would deserve the execration of the world! But vaccination is the child of faith, a kind of talismanery, supported by fear and cherished by laziness. Habit, science and law, have declared:

1. That vaccination has not the least injurious influence upon the life and health of those who are vaccinated.

2. That vaccination offers the best possible security for the extermination of a tendency of being infected by smallpox.

3. That vaccination is the only means by which smallpox and its destruction can be finally banished.

These three articles of social faith have played the greatest mischief with presumed wisdom of legislative powers, and have fooled the millions; for a

really wise man only acts thus, when he knows fully what he is about. Faith is not knowledge.

A state faith is not exactly a crime for itself; but it is an evil, and a very great one, when the laws which are based upon and deduced from it, and which shall tend to satisfy society, lead to the very opposite result. Let us then examine these three articles of faith more minutely.

FIRST ARTICLE OF FAITH

§ 12. The sunray warms; the moonlight charms; the water moistens; and poison poisons. All this is nothing new; and government knows it too, when it speaks so sweetly to the nation: 'Not the least harm comes from vaccination!' Every medical report, every look into the lists of death and their causes, proves it; and yet the government says gladly, "O! Not the least harm has been done by vaccination!" The first is a senseless lie; the second a conscious one—a Persian lie! But the Shah lies, and, therefore, all Persians lie! Thus the government officers and the Faculty lie, and the uncounted masses of fools merrily follow suit! *Et nemo injecit in eum manum.* Marc. i. 31.

"Come in, madam! Be not afraid! Does this little one belong to you? So, so! What a lovely babe! Truly, a young hero! A perfect ideal of health!" exclaims the vaccine physician to the trembling mother, who is full of doubts and misgivings. "Here! Read yourself; read the new law, provided by the wise legislators of modern Athens. It says: Vaccination does not do the least harm!" This overpowers the last gleam of God given instinct in the doubting mother soul; the snow white, pure little arms are bared and offered, and the poison 6—12—18—24 times incised; for it is of acknowledged importance, "that the vaccine poison should be forced into the unwilling body in SUFFICIENT quantity! THE MORE THE BETTER!"

Philanthropist, let us pray in the words of the holy Crucified: "Father! Forgive them, for they know not what they do!" And they honestly acknowledge the fact.

General measures we base upon general laws! The law of Nature is, that she rewards us with pleasurable sensations, as often as we have satisfied one of her calls. Is, therefore, vaccination a natural necessity? Would the child, then, feel so

miserably, and be sick after it? Instead of this, the sovereign nature of the child declares a revolutionary war, as soon as it is poisoned with the vaccine lymph. The powers of self-protecting nature and of the unnatural invasion, are drawn up like two hostile armies, in full battle array. The invading poison attacks; the combatants get heated; the struggle becomes vehement; the child is dismayed; the fever rages; the skin burns; the pulse runs high and quick; it storms.

"For God's sake, doctor!" exclaims the mother, ringing her hands, "my child! My darling child! Vaccination has hurt it!"

"Calm yourself, good woman, this is nothing but the vaccine fever—the extinguishing fever!"

Mother: The ex...tin...guishing fever?

Doctor: Yes! The same.

Mother: What is there to be extinguished? My child was perfectly healthy; it was never yet the least unwell. As little as I and my husband.

Doctor: (Sheltered behind his medical and mystical prerogative) You do not understand that; you better quiet yourself. Read here the laws an enlightened legislature has made and provided!

And the disconsolate mother is silent! And the doctor is silent too!

The storm rages on. The suffering child screams; throws itself about; cannot find rest. The mother prays, and peace ensues. Nature has conquered! Victory! Victory! The child is quiet and exhausted. The mother smiles through her tears. Victory! Triumph! The hostile, poisonous intruder, is repulsed to the spot where he first invaded. There he is! Shut up, fettered, captive lies the wild destroyers in their holes; but fiery red and swollen for anger, looks victorious Nature out of the inflamed arm.

Mother: God be thanked! The eruption is here; what anxiety I have had!

Doctor: You see, madame, such things you do not understand: as I have told you before.

Mother: Yes! I was wrong, and beg your pardon a thousand times.

The sacred order of Nature is saved, the anarchical invasion of the poisoned lancet subdued, and martial law proclaimed. The law of Nature is: ejection by suppuration! The pox suppurates, falls off in ugly scabs. But the general welfare of Nature has suffered by the frivolous war.

Mother: My little one looks yet very pale; one can see how exhausted it is.

Doctor: Thank God, madame! The reactive fever was splendid; and now you can be assured, that it will never get the smallpox.

Mother: O! How shall I express my gratitude to you!

Let us now look deeper into this hocus pocus of vaccination. The infantile organism is the purest expression of natural perfectibility. To interrupt it, is a great crime; but to interrupt it senselessly, is a monstrous crime. Let us be grateful to God, who directs the evil to turn to good. Let us revere the guardian angels who watch unceasingly over our cradles. Let us admire all powerful Nature, which is not so easily brought into this serious and lasting disorder by our perverse intrusions; for otherwise, there would hardly have remained a human being alive. But let us not praise vaccination, even if a great many children get alive through it. Nature is great! A most astonishing proof of this give:

a) Those children, particularly boys, whose strong health will not accept any poison at all, who do not form those vaccine blisters, but who, as it were, reject indignantly the intrusion, and throw out the poison again by different kinds of eruption and ulcerations.

b) Such who have carried out of the violent struggle of the natural smallpox, the reward of perfectly pure bodily health; and

c) Such to whom a kind of family immunity might be ascribed; that is, a mixture of fluids, the chemical vitality of which would rather permit a hundred other disease forms, than the smallpox, (and vice versa) Casal vaccinated a boy in vain;

The second time—in vain!

The third time—in vain!
The fourth time—in vain!

He then made him take a quantity of pulverized kinpox scabs in a soup. On the fourth day, the poor boy begun to vomit violently, and to suffer from nervous symptoms. This condition lasted for six days, and finally there appeared on his body one hundred and eighty kinpox pustules; Whether the stomach of this victim of onesided scientific perversity, threw its grateful acknowledgment for such favors right into the face of the experimenting Doctor, is not mentioned.

§ 13. The tender age of infancy is very susceptible for external influences; why not also for any kind of poison? And it would have to succumb often to the change in temperature, to carelessness and perversity in education, and many other untoward circumstances arising from false views and inherited prejudices, if our kind Creator had not provided safeguards for all emergencies. This guard forms the tendency of the child to oppose every intrusion and attack, by a wonderful reaction. We have seen such a spectacle in the preceding pages!

Would to God that the struggle be always so fortunate; I would be silent, and suppress my indignation! But it is not always so! The susceptibility, as well as the reactive power, and therefore also the result of the physical struggle are so different, and varying in manner and strength, as the millions of flowers of a meadow, cut down by a hailstorm. Many a book might be written on this subject alone, but I have neither time nor space, nor inclination for such a task.

Second Scene: The hostile invasion of the beastly pox is also totally repulsed by the powers of nature, (*exercitus vitae*) but the marauders are not only caught by the arm, and driven out of the land, but all the boundaries are infested, molested, and exhausted by these.

Besides, and after the vaccine eruptions, various skin affections make their appearance In children:

- a) papula;
- b) exanthemata;
- c) pustules;
- d) furuncles, which trouble the little ones more or less, or which they secretly breed for years.

"The child will not thrive; there is always something the matter with it!"

Mother A.: My child has got an eruption all over the body, like heat blisters; it has scarcely any rest for itching; on its cheeks and lips there are poison blisters, and it is sore here and there.

Mother B.: My good for nothing nurse left the other day the door open; my three children have taken severe colds. I have sent her off. My poor Molly has got now erysipelas, Lizzie something like nettle rash, and Tom even the measles. They are all very unwell, indeed; but the worst is that we apprehend with the babe—the scarlet fever!

Mother C.: I am afraid that my children have handled the mangy cat of our neighbors; I never will be again the neighbor of a baker. It is unbearable—all my children have the tetter: Charles on the head (flavus) John in the face (impetigo larvalis) and Bob on his thighs (impet. sparsa) It is a very disagreeable sight, and smells so badly. The worst of all is—and I am fully satisfied of it—the Doctor has made a mistake, and not thoroughly extinguished the smallpox poison, for my boy James has got, besides the vaccine pustules, the real smallpox, (variola, varioloids, varicellae). Yet I must say that the boy has had the extinguishing fever very severely: at least the Doctor said so.

Mother D.: All my happiness is gone; I was too happy! Since my unfortunate boy has been vaccinated, he has been a perfect Lazarus. Every part of his body breaks out in most painful boils and abscesses in the armpits, on the neck and body in general; his arms and feet appear to be full of matter; the poison comes even out at the ends of his little fingers (panaritium) My only consolation is, that the pale poor little thing can eat well.

As the unprofessional father doubted formerly, so is now the physician startled: "Mea culpa! Mea maxima culpa!" The distress of the miserable parents drives the blush of embarrassment in his face. "Hem! Hem! But no!" he deafens himself, "no, the vaccination cannot be the only cause of all this pitiful woe; all the world vaccinates, and lawmakers, even in the most progressive and enlightened communities, order it! I then will vaccinate as long as government and the people desire it." The son of Heaven, in China, orders the Mandarin to be whipped, who again has the people whipped: "*Lege legis Doctor legem servabo servus, nec non physicus longus! Nonne boves Deo curae sunt?*"

§ 14. Third Scene: The ground is less guarded; the lancet army penetrates deeper into the land, into the intestines of the country. They find them wonderfully fortified. Everywhere electric batteries, (plexus), like small fortresses, with starlike ramifications, surround the grey-reddish nervous knots, (ganglia), the arterial streams; the principal fortification protects the stomach, (ganglion solare) and 24 to 25 such detached forts on each side of the spinal column defend the spinal marrow.

The rapport with the head, with the members of the whole body is secured. Thus prepared and armed, nature awaits the attack of the kinepox. They approach; nature defends herself by violent fever, the child burns, calls for water, moans pitifully, lets head and limbs hang loosely; the heat increases, the nerves of the spinal marrow hasten to succor, by cramps and convulsions: John dies the second day—the tendons jump, the cerebrum participates, sopor, contortions ensue: Charles dies on the fourth, sixth, tenth day—the struggle gets finally weaker, is continued yet for some weeks: David dies of hectic fever!

Mother: God! My child! Doctor! My poor child, it is dead! I ought not to have had it vaccinated!

Doctor: Hero the teething is the cause, madame, a vehement fever, an inflammatory fever, was complicated with the teething.

Mother: Yes, yes! And this fever was what you call the extinguishing fever! God! My child!

Doctor: (Sighs and sneaks away with deep and very painful emotions)

It is a beautiful, a very wise law, this vaccination law! The brute-pox has gained some advantage, and reaches now the mucous membranes. It is principally the nerve fortress of the stomach, which resists vigorously; the storm rages in the arteries, (abdominal pulsation) the mucous preparing glands (muciparae glandulae) envelope the enemy with tough phlegm; he is subdued. Nature conquers and triumphs here by diarrhoea: Tom cuts himself through; Bob succumbs in the flight; there, by vomiting, George gets through, but is severely wounded; Harry falls. The discarded enemy runs now wildly up and down; James saves himself; Wash dies of choleraic symptoms; the fortresses (ganglia) inflame and discharge whatever they can (cholera)

The main body of the partially subdued enemy takes refuge in the blind gut; establishes itself there: Ike is saved with great difficulty by art; Charles's stomach gets perforated; he dies of softening of the stomach. Fire! Fire! The enemy's fire torch blazes in the intestines! Sam can hardly be snatched out of the flames; Ned dies of enteritis. The poison pox takes the burning place! True, faithful Nature, succumbs not yet; she struggles for life and death, and she succeeds to take hold of the leaders of the invading rebels, and shuts them up in the exanthem of the coating of the intestines. Again she proclaims and executes martial law: she ejects pus. But here on the inner coating of man the execution is far more difficult than on the external surface.

A sensible physician helps Fred through in the process of ejection (typhus, nervous mucous fever); the ulcers in the intestines suppurate and heal; but with Anna they heal not—she dies! Help! Help! The child suffocates; the brute poison moves from the stomach into the breast. What a terrible catarrh! Lizzie sinks under her choking cough, and Emma, with asthmatic want of breath, under convulsions. Dost thou hear the distressing call of Nature, the whooping cough: this horrible, pitiable woe of a child? Dost thou see the colossal mass of phlegm by which Nature tries to defend herself, as long as she does not feel her fever strength equal in a match with the poison power?

How rapidly does the scourge progress! The terribly ominous commotion begins already the first, fourth, seventh, and ninth day after the vaccination; many, many children fall its victims; and again, others are more fortunate; but mostly some misery remains. The mucous membranes, particularly those of the organs of the senses and generation, (in adults) attest the sufferings and dangers originating in the inoculated kinpox poison. Ophthalmia, otorrhoe, fluor albus, prurigo, etc.

§ 15. What a sea of tears, what an unbounded field of misery lies behind us! Let us add to this the dead, the invalids, the infirm, that come forth out of these struggles! The field on which the battle was so fiercely fought, is before us, disordered, ruined, weakened, devastated; it is the extensive field of digestion and breathing, the basis, the root of life. Not enough that these terrible traces are reproduced year after year, but the poisoning goes on again and again, and poison is heaped into the already poisoned bodies. And this is the reason why the affections of the mucous membranes, which were formerly only 1/2 of all diseases, have now increased to 5/6 of their number. Thou miserable abdomen! Thou miserable chest! Is Pandora's box not yet empty?*

*Answer: Not as long as the box of Pandora is the vaccinating case of instruments!

Gone is all faith in the doctrine of “not the least injury.” Nothing has gained but the history of errors and fallacies; its pages show innumerable new experiments. The people have acquired by this vaccination:

1. A glorious degree of sickly sensitiveness of the stomach and intestinal canal, accompanied by open and hidden disturbances in the whole digestive apparatus, namely, diarrhoea, dyspepsia, phthisis dyspeptica, liver and spleen suffering, never known before.

2. An entirely new disease (since 1806) which domesticates itself every year more firmly, the typhus, which is a mucous fever with ulcerations and pox eruptions in the abdominal viscera.

3. The daily more frequent appearance of a new children disease, which Millar observed and presented (1755) as the first fruit of inoculation in England: the asthma Millari.

4. The poor children have gained, or rather regained, in immensely more malignant form, (since 1806) the long before forgotten inflammation of the windpipe—croup. As formerly, in England, Nature revolted (1738) against the inoculation of the human smallpox matter, and tried valiantly to remove the poison by means of catarrhal gangrenous angina in the throat; as children for nearly forty years suffered the tortures of horrible strangulation difficulties, and many thousands of them wretchedly perished; so appears now here and everywhere, where vaccination is introduced, the croup, somewhat milder, because the kinepox is somewhat milder, and tortures, frightens, sickens and kills (already some forty years) the innocent victims.

5. The whooping cough has gained in strength and extent immensely.

6. The human family in general, has acquired a monstrous increase in consumptive and hectic diseases, which mostly originate in the digestive apparatus (*phthisis dyspeptica*).

7. An entirely new disease, softening of the stomach (v. Jaeger and Camerer) has been added since 1811—1813, to our already immensely large catalogue of

destructive diseases.

8. Our young women have gained, since 1822, a generality of chlorosis and fluor albus, of which we did not dream before.

9. The whole human family have been enriched by the acquisition of the Bengalian poison snake—hydrophis; the tropical wild pox poison, the cholera; which now has established itself among us thoroughly and habitually.

10. Our generation has, besides all this, gained a far greater susceptibility for the smallpox poison, which will ravage in the above mentioned disease forms of the mucous membranes in the interior of the organism, till the feeding of the poison by vaccination, ordered even by laws, sanctioned by usage, and held up by the faculty, is forbidden under severe penalty. Then only will Nature be able to recover all her own; and then will the external smallpox reappear as a redeeming means for the internal destruction.

Doctor: Bring your babe now for vaccination!

Mother: How you have frightened me, I tremble all over!

Doctor: Why? what is the matter?

Mother: Pardon me; but I feel a perfect horror creeping over me at the mere thought on vaccination, since my poor Charles has died in consequence of it.

Doctor: Nonsense! Charles did not die on vaccination; do not believe such a thing. He got dysentery while teething.

Mother: I beg you to wait another year; Tom is now very delicate indeed.

Doctor: Only the better! And I have this very moment excellent, fresh vaccine lymph.

Mother: In God's name be it done! But, doctor, the responsibility rests on your shoulders!

Nine days after this conversation and following vaccination, Tom was a corpse, with two vaccine blisters on each arm.

§ 16. Fourth Scene: The boundaries and the gates of the land are poorly guarded; the first advance of the fever troops is inactive. Nature, impotently urging on the miserable powers of the body, struggles against the beastly pox in the spheres of the mucous membranes. There is a great deal of mucus, but not sufficient to stifle and smother the enemies. The police force (the worms) of the intestinal canal is increased. This measure is for some time successful; but the intruding poison soon overpowers the worms also, and the skirmishing in the streets makes the assistance and interference of a physician necessary (*anthelmintica*) Even now the quiet is of short duration!

The poisoning eruptions sneer at the catarrh; they move into the throat, drying, burning and exhausting; the thirst is enormous; the irritation of the eyes and the nose, and the sneezing, torturing. They laugh at Nature and Art; for they delight to play in the most various catarrhal forms—not in storm and rain—no! In the most beautiful, warm, dry weather, in the full bloom of the fields. They play for months and years, up and down like ebb and flood. Nothing will draw the enemy out of his positions.

"It is almost to despair," exclaims the physician, "that is no cataarrh! I was deceived! What a suspicious smell! It is clearly infectious! It must be a poison; it consumes the child's color, flesh, roundness and nervous energy. You see how it shrinks, as if frightened! How irritable, pale, tiny and miserable it is! I must assist poor Nature! And observe how Nature gratefully and readily gathers her strength, and calls on the serous texture for assistance. The struggle is slowly Renewed; the poison storms on the one side from the mucous membranes against the serosa, and attacks on the other side the serous inner coating of the vessels. The heat, and excitement is here, and is there, and soon burns the head, (*Arachnoidea*) soon burn the joints (synovial membranes, *bursoe mucosoe*).

The fever rages—the life struggles all over in the blood vessels, nerves, fibres, etc. The diaphragm catches fire! The rebels cut and thrust here and there through the head, chest, stomach, spleen and liver; no member of the body will act. Every function is at a standstill. The prime of the poison falls finally also into the centre; the inner coating of the pericardium inflames. How then the heart storms in anxiety and despair! How the pulsation runs wild! The stinking breath indicates a retreat of the enemy (contagium) the room is pestilential.

Open the windows! Air! How the nerves tremble! What a tumult and uproar!

(*coctio febris*) The tongue is in a tremor. Water! Water! Heroically courageous, observes the physician, he quiets and cools; and orders the route! Heavens! Sam sinks in the storm! Jim makes a last effort. The skin steams! Pestilential smell! The enemy flees; victory! the crisis has arrived! Out of all openings flies the pest. Others are fighting yet. If we had only nerves and vessels, complains the serous party! Take courage, exclaims Nature; the watchword is: Life or death! You are completely shut-up sacs; exhale, by all means, instead of your usual vapour, water; drown the incendiaries. And see, the disease is extinguished in the watery effusion: *hydrocephalus acutus*, *hydrothoraxy hydrops pericardii*, *Anasarca*, *hydrops tunioce amnios*, *hydrocele*, *hydrarthus*, etc. The formation of furuncles and abscesses fail not to make their appearance in the later time of recon valescence; the law, ejection by pus, must be fulfilled.

§ 17. Let us examine, for once, the viscera of an animal that has been butchered; the glassy shining exterior, f. i. of the intestines, of a bladder, etc., shows the serous texture which the wisdom of the Creator has much condensed, and left without blood and nerves. In such textures are sac-like enclosed all those viscera, that are most necessary for life, namely: the brain, the organs of sight and hearing, the lungs, the heart, the liver, the spleen, the stomach and intestines, the kidneys and bladder, the joints, etc.

The inflammation of these sacs is very painful, violent, and rather difficult to manage, because it is generally combined with erysipelas; it affects often most seriously the organs themselves, which the sacs are to protect, and thus even life itself. The medical guild throw in this sanctum the poison firebrand; they carry the terrible furies of death, suffering, and sickness into the very life springs, and exclaim: "There is not the least injury done!"

First Mother: What a most awful affliction! Think, my neighbor's lovely boy has died this moment!

Second Mother: Is it possible? That fine, handsome boy, who began already to walk, and laughed so sprightly, is dead?

First Mother: The same! His poor father is nearly crazed; it was his favorite.

Second Mother: But I have seen the child only the other day, as well as ever!

First Mother: Last week he was vaccinated; he then began to sicken, got inflammation of the brain, and died.

Second Mother: A good many children die, nowadays, under similar circumstances.

First Mother: The father accuses loudly the physician, as the cause of the death.

Second Mother: Our houses of refuge are now changed into hospitals by the introduction of vaccination.

First Mother: Another neighbor's three daughters have been revaccinated lately; one of them has now hip disease; another is as ugly, yellow, and lean as one can be; and the third, a truly excellent girl, coughs all night, and is very weak. We hear her screams in our house; she has such terrible pains and stitches in her breast and left side.

Second Mother: A friend of mine became bedridden, for a long time, after revaccination. Suddenly she got most awful earache; three physicians were called in. But all their endeavors to help were in vain. Finally, a tumor formed in the ear. The physicians took it first for a polypus; it showed itself to be afterwards an abscess, which discharged a great deal of yellow water; and now she hears with that ear not a sound; you would hardly know the poor woman.

First Mother: The same thing happened to a friend of my husband's; but, in his case, the difficulty settled in the eyes. On one eye he is entirely blind now; the other is so weak, that he cannot bear any light.

Second Mother. Our Doctor has vaccinated himself four times. The last time, two months ago, he got very sick. As soon as he had recovered, and began to make visits, he got the real smallpox, and suffers now dreadfully, he has lost all his hair.

§ 18. The FIBRINE exists in our chyme, and in great quantity in our blood, and forms the principal substance of our flesh. Muscle and tendon differ from each other, like the external and internal skin of the lips; they are therefore one and the same substance; and it makes no difference that the flesh is red, and the tendon silvery. This beautiful silvery shining texture is the fibrous texture, which gives the body its elasticity. It surrounds all our bones, surrounds our whole brain, as well as its single divisions, our spinal marrow, all our nerves, our eye, our heart, all our blood vessels: forms firm capsules round our joints, sheaths ligaments divisions for the mechanism of our life. It is, therefore, besides the

bones, the firmest protection for all our organs. This very firmness is their own defence: while the serosa are protected by their vapour and water, the mucous membrane by mucus, the external skin by the fat. This is the reason why the Creator gave to the fibrous texture so little conductivity, particularly of poison.

But even this bulwark is reached by the vaccine poison! Do you not see and feel the track of this beast: the dreary vestiges through the regions of your nature, till it arrived there?

Look at the immense number of rickety children, increasing, year sifter year, at the most rapid rate ever since, and wherever other nations have imitated the vaccination of the English! As horrible as now, our forefathers did not see this disease! Crooked, blind, lame, hunch backed, full of suppurating boils, cramp, with dead pale, distorted pain features, moves this world of poorest children before our eyes. What is man? you sigh! But ask—rather exasperated: What did man do? And he a physician, too? A government? With tears of gratitude buries even a doting mother such a miserable being, whose life would have been a torture to itself. "Not the least injury!" For the child rises an angel to heaven!

Here the thought dies! The pen is silent! The fifth scene is too tragic! A feeling of sorrowful indignation alone speaks yet. Let others then talk.

When Abraham, at the command of God, was preparing to sacrifice his son Isaac, God sent a ram near him, in his stead. Christ says: Nobody will give his son a stone, when he asks bread. What does the public do, when the physician poisons his own child? Let us hear what Heim says: (Pockenseuchen, S. 633)

"Dr. B., in S., vaccinated his own, perfectly healthy child, about one year old. The suppuration fever was so strong, and the pustules flourished so finely, as Dr. B. had seldom seen it. But, ever since that, the child began to be sickly, had nearly always some diarrhoea, increased thirst, some cough—one furuncle after another made its appearance—the last a very large one, besides some other smaller ones, on the seat of the child, broke eight days before its death. Yet the child tried anxiously to save his foot from every touch, while it did use it, and while it was yet happy and frolicsome, as much as its many troubles permitted it. The foot retained, for some days yet, its natural color and form, and the father could therefore ascribe the inflammatory excitement, which expressed itself in loss of appetite, thirst, and nightly orgasms, only to teeth development, (ah!) or to the swollen inguinal glands, (ah! ah!) or an irritation (what kind?) of the

ischiodic or of the crural nerve.

“The continually increasing heat (what heat?) made the father think of an inflammation of the fibrous muscle sheathing of the foot; the clearly expressed desolation, the want of appetite, the often repeated attacks of involuntary nausea, indicated to him bilious complications. The foot began, finally, after a few days, to get very hot, and to swell considerably, while the color of the skin remained yet the same; and now there could be no doubt of an inflammation of the periosteum. A vomitive removed, nearly indigested, everything the child had taken the last few days. In the following night, the heat increased more and more. Three leeches, and the rubbing in of mercurial ointment, produced first so much alleviation, that the poor child, who had not slept for 24 hours, fell asleep, and slept five hours in succession.

“But, the next morning, it was clearly visible that the child's strength was rapidly sinking; it ground its teeth, and rolled the eyes while dozing. When awake, it had full consciousness, and begged, with fondling caresses (its father! its physician! its poisoner! its murderer!) for help. The forenoon, it was very restless. In the afternoon, there was some quiet; and now appeared in the middle of the shin bone, a bluish-red spot, and on this some nut-colored pustules, filled with matter; although the little sufferer sometimes started up, as if frightened; he remained pretty quiet till two o'clock, when he began to show difficulties in breathing. An empty choking got soon combined with this changing hard breathing, which returned more and more frequently, and lasted longer and longer, and finally ceased in the forenoon, about ten o'clock; the breathing got now more difficult yet, so that no respiration was had, without exertion and groaning; the innocent victim retained all this time, consciousness, and and prayed for relief (to whom?)

“A tepid bath subdued once more the attacks for half an hour, but after that the child sank very rapidly, and death relieved the sufferer about two o'clock, four weeks after the vaccination. The dissection convinced even the wretched father of the fact, that the sole cause of the disease and death of his own child was his own act, and nothing but the vaccination!”

This heinous crime, this history of cruelties, is narrated by a father, by a physician, by so eminent a man as Dr. Heim, in his official reports; and yet physicians dare to assert, and governments dare to contend:

"Vaccination does not do the least injury!" I could cite here, from the same

pages, more atrocious details of *kachexy and paedarthrocace*, of which Dr. Seyfer, in Heilbrom, gives the sad details. Every honorable and discriminating physician could add to his catalogue of horrors, the knowledge of which would make our hair stand up. But enough! Be silent reflection!

§ 19. Sixth Scene: The rebels triumph! The beastly hordes of the vaccine poison conquer the land, settle down, and establish themselves in it. The throne of monarchical nature, the brain, is vehemently shaken, or even softened; the mountain passes and their springs, the marrow and its nerves, are blockaded, teased, or also softened; the fortifications of the body (the ganglia) and the magazines of industry and economy (the glandular system and the mucous membranes) are in their power. The fever troops of the nerves and of the blood lie beaten and prostrated. The guard alone, the *anima vitae*, stand yet firmly, and is not conquered.

She alone continues the struggle, in periodical attacks and skirmishes. These attacks proceed from the heights of the spinal column, invading soon the dominion of respiration, soon that of digestion, soon that of generation, soon that of the mechanism of the body (intermittent fever) Nature rallies also once a year, generally for a pitched battle (some more violent and decisive fever or inflammation). But she is unable to gain, unassisted, a complete victory, cramped as she generally is by drug interference, and if a sensible physician does not help her in her efforts.

The processes of development play in the child the principal role; therefore the vaccine poison rebels mix themselves most readily in the organs, particularly active in these processes, and thus the ruin of the organism is secured for life.

We see here, in this picture, how human life is embittered and spoiled—a life that is never healthy, and seldom really sick—the comfort of the drug shop. Since the creation of human beings, there never was such a variegated, topsy-turvy chaos of sufferings of the spinal column, as at the present time: no wonder that physicians and patients feel as if they should despond! There remains only one gain for us—rejoice, and erect triumphal arches from the birthplace of the wench, who instructed Jenner in the vaccine mysteries, to the hall where the Massachusetts legislature lately hatched their vaccine law, besides other similar progressive legislative measures, that astound the civilized world—rejoice of the grand acquisitions made by vaccination: the miraculous ORTHOPAEDIC INSTITUTES AND THE WONDERFUL TENDON CUT! Rejoice, Madame, of

the discovery of thy hidden steel supporters; thou hast not a smallpox mark in thy yellowish pale face!

Heim says farther: "The scrofulous diathesis appears with others at once, in the eyes and enlarged glands. That vaccination increases scrofulous tendencies, and develops its visible products, is a fact that cannot be denied."

Rejoice, then, of thy feeble, brick red, or blearing eyes, which look like window glasses in winter time! Rejoice of thy glandulous, knotty, enlarged, matter discharging neck! Rejoice of thy stunted, crooked growth, of thy Roman X figure—thou hast not one smallpox mark on the surface of thy body. Drink cod liver oil, be moxa-ed, cut, stuck and burnt, run through all the healing institutions, science and humbug may have established: if thou believe that to be better than to have possibly a light mark in the face, over which thou might jest and rail, and with which thou couldst dance, sing and enjoy life.

§ 20. If all this come already to pass on the green wood, yet the ideal of health, what shall become of the dry, that is, of the children produced by such a miserable generation as ours is at present? Vaccination treats them all alike; all are vaccinated: the child of the drunkard, of the famishing, of the syphilitic, of the cancerous, of the gouty, of the old man, of the voluptuous mother, of the consumptive, of the dropsical, of the leprous, of the fool, etc. *Horribile dictu!*

Seventh Scene: The physician stands deeply moved before the lifeless body of his vaccinated victim; the wailing of the stricken family cuts his heart, and causes him the most painful feelings. He would like to justify himself, and cannot find anywhere an outlet. He hunts in the wide empire of possibilities in vain for a name—in vain even for a pretence. He struggles with himself; he must acknowledge it to himself, he must confess before the whole world, that the child has died on the reaction of vaccination.

It is so perfectly clear a case, that all talking and mincing is in vain. Wherever tables of vaccination are regularly and carefully kept, the unavoidable truth stares in the eyes of every reader, that vaccination itself alone kills a large number of children, while it gives to every other disease a malignant character! When a criminal is executed, the whole country is aroused; but nobody says anything about the thousands slain by the act of vaccination! The earth covers them quietly. It is said, the dead are dumb and do not speak. It is false; they do speak, and accuse science, government, and the people, all concerned. Whoever

supports and praises a false method upholds it as a true one, must some time or other suffer for all the victims slain by it. Does the axe of the executioner compare with a false medical method?

Has a Herod, a Pharaoh given the royal decree: "Vaccination does not do the least harm?" or a legislature of an enlightened State of our Union in the 19th century? Would a merciful community of Christians condemn all their children to death and misery? Or is such a state of affairs the work of Satan? With painful care deliberates a jury about the verdict over life and death of a criminal outcast, whose existence is a curse to the community; and another jury, composing parents, brothers and sisters, decide without hesitation over the fate of their innocent relation, who is never even heard in the case. O Lord, deliver us from evil! &&&

Through a lady, (Montagu)—through Jenner's country girl—through woman, then, again, this sin has come into the world, and death by this sin. The female sex, and principally the young mother, has most to suffer from it. That is Goethe's curse of Nature! Miserable expiation! The conscience of the father and of the physician revolts against the abomination. Will the public and the government remain quiet?

Already in the year 1801, two years after Dr. Ballhorn, in Hanover, (in May, 1799) had vaccinated the first child in Germany, Dr. Sybel wrote:

"It cannot be denied, that, (with all respect due to vaccination, be it said) not every one who is vaccinated, is saved, and that a great many examples bring before our eyes the most deplorable cases, where, by means of this celebrated discovery, father and mother have been carried away from their children, and that whole families have become victims of death. Cases, where the most unfortunate consequences remained behind, have brought upon this new method the most violent execrations."

Such was the dirge of the physicians on the continent of Europe, soon after the introduction of vaccination. What will the tune be now, after it has decimated and destroyed the human family?

SECOND ARTICLE OF FAITH

§ 22. "The vaccine pox offer the best possible security for the extinction of the tendency to be infected hit the real smallpox," exclaims with satisfaction, the easy, thoughtless wanderer on the beaten track, and science shakes grimly the mane.

Diseases are the effects of diseasing causes; each disease has, like the plant, its seed, its own kind, its nature, its course, its fruit and its end. He who does not know all these things, can neither protect from its poison, nor extirpate it. As long as the physicians must acknowledge that they do not understand either the cause, or the nature of the smallpox, as well as of the kinpox—that the manner in which the vaccine acts, is to them a terra incognita, and that they do not know how to attack the smallpox poison—so long remains vaccination a medical foolery; on account of its consequences, a crime against humanity; and, wherever the laws require it, a legal atrocity. An immense amount of learning and investigation has already been applied, for the purpose of ascertaining the place of the origin and nativity of the smallpox—whether it comes from Arabia, from the Red Sea and Egypt, or from Ethiopia, or the interior of Africa—of which, although so near to civilization, we really know nothing. They were sought for in the works of Herodot; in the first chapter of the Exodus of Moses. Some thought to find them with Pharaoh and Job, in Syric Orfa, on the wood confines of the cold zone, and where the pepper grows.

Commerce, travelers, soldiers, beggars, have been accused of having brought the disease, and yet the poison is a product of your own body; and because you will not believe it. Nature throws it unceremoniously into your face. Seek, then, here for it! Here you will find it! What devours, is not a spirit—a breath! Can you not touch the pustules and boils with your own hands? And yet you opine it to be a spirit, whom you think to be able to exorcise with the vaccination spell! The pus is the dress of the poison; why, do you not undress it?

You must see the poison naked, and then you will recognize it as the creeping hydra of your life, of which you have to take care; you will then see that it is the mother of many large and small children, to whom nosography gives many different names. The large children are the epidemics of pest, smallpox, cholera, yellow fever, grippe, of many pituitous and nervous fevers, of the PUS-FORMS of genus Homo; the smaller jones have been already mentioned above. As a metal appears before your eye in various colors and forms of crystallization, soon mixed, soon pure, soon worked: so shows the human poison itself soon

more hidden; soon free in the softening of the stomach, dysentery, cholera; soon stamped in typhus ulcerosus, and in the suppurated precipitates on the surface of your body.

And when it has gained the day, as at present, principally by vaccination, every disease dresses itself after its fashion. The poison is more honest than you are active. You persecute the wolf, the bear, and innocent dog (whom your heartless children have teased to madness) you pay premiums for their extermination: but you let the poison murder myriads; and yet you can touch it with your hands; it appears quite materially in and on you.

§ 23. History proves clearly and indisputably the destructive effects of this poison; and yet every one runs as if mad, into the arms of Jenner's country girl! We may indulgently excuse such insane things in an impulsive, passionate, young and inexperienced fellow, but the deliberate wisdom of grave age, ought to guard against such juvenile ebullitions. Take your Thucydides, upon whom you prided yourself so much, when yet a boy, read how beautifully he describes the disease of Rome, which spread over the world—how there was (431 B.C) not a youth to be found fit to be a soldier; read his Athenian pest, and the battle of Potidaea—hear what St. Cyprian says about the epidemic of the Occident (250 B. C) which lasted fifteen years, whence we retain yet, "black," for the Christian mourning color—hear the complaints of the angel pure Aetius (557 B. C) about the bubo pest, which showed a particular predilection for children. At Mahommed's birthday (572) throws Nature smallpox in your face. She wished to be long before understood; but you were a lazy fool, and remain it truly to this day. She took you 589-594, by the nose with sneezing, yawning and death; you died and exclaimed, God help!

"Now," says Nature, " I will then let influenza knock every century at the door of the human family." In vain! The crusades came, the body followed the spiritual impulse; and even the childish organism was (1211) carried away by this blind power; 50,000 children pilgrimized! In vain!

"Go, then," exclaims Nature, in despair, "go, useless black lead-colored anthrax, fire red Antonius—fire; thou Jordan itch leprosy; thou episcopal violet carbuncle; and thou Mongolian plica, (1286) perverse men ask for black and white I most then send them a number of barren years of famine, followed by death!" There came (1348) the black death over all nations; it rolled in blood and nerve matter. Humanity saw now, certainly, black and white, but did not

comprehend the friendly intention of Nature, who showed them here more clearly yet, than in Athens, that the poison is not a spirit, but a visible and tangible matter, which likes to dress itself in pus; and that suppurating carbuncles and bubons save life, as, nowadays, the smallpox. Pest and smallpox reign then supremely! And both have gnawed the human family to pieces in a terrible manner, and nothing was done but to count the vestiges and the corpses that were slain during three centuries. Chemistry did not seek for the killing tooth; and Medicine did for that very reason not blunt its sharp edge.

Finally, there appears a lively fellow—the English student Jenner. "A student of medicine!" exclaims Nature, like a happy bride, "he must, of course, understand me, and especially the exploring art—chemistry!"

But Jenner was quite TOO natural; he did not stick to the udder of the cow, but ran after a country wench. *Aliena uhera suxit*. Deceived Nature conjured up in her fury entirely new diseases in the present century. Notwithstanding that, the other diseases also do no longer correspond with the condition of the weather or aliments, but as a curse of Nature destroy our intestines; the people shout in blindness:

"Victory! Triumph! No more smallpox! Hurrah for Jenner and his girl!"

But that destructive poison, which is no spirit, but visible, tangible, smellable, tastable, and even audible, that tooth of our age gnaws on and on, and will yet many years make its sharpness felt.

That poison, generally called smallpox poison, goes, and will go unrestrainedly its historical and characteristic course, till it is totally eradicated. It boasts impudently, that it will always again proceed wherefrom it proceeded first. There is the origin of the smallpox.

Heim says: "Thus the truth of a spontaneous idiopathic development of smallpox matter out of conditions and circumstances entirely unknown to us, without the influence of infection, is beyond all doubt established."

The people stuck faithfully to all that was ordered for them; but what does science and government do? The people are certainly deceived in their expectations; they suffered immensely from vaccination; they bore willingly strict quarantine measures; and yet they had and have smallpox, varioloids, etc.

If we will even overlook the general bodily injury inflicted by all these preventive means, which so frequently end in death. Heim, the penetrating thinker and physician adds with deep foresight:

"The disease must consist in a change of the electrochemical process of the nervous system, which is proved by the affections from which single parts of the spinal system suffer, by the constant pains in certain regions of the body, particularly of the neck and back—by the seizure of the great connecting nerves under multifarious crampy, dyspeptic, nauseous symptoms, more yet by the undenied influence on haematose."

Eichhorn confirms Heim's views, by saying:

"It is certain, that the smallpox matter forms itself in the blood and lymphatic system; it is, as it were, hatched in the lymphatic glands, and communicated from the centres of this system to the blood and nerves."

Nature speaks out of infants without falsehood and deception. The infant is personified truth; it shows in the lap of the mother, at the entrance into the world, in the swaddling clothes, the presence of the smallpox, no matter whether the mother has had them or not. Poetic superstition insists with tenacity in older children, often on external infection.

§ 24. The younger an individual is, the more frequently, but also the purer, is the poison formed. Why don't you seek it in its cradle here? Are you afraid of Fred. Hoffmann and his friends: Boyle, Sydenham, Schulze and Cullen, whose mechanical dynamic rosary has been prayed for, for a century, by the medical profession—without being heard by Baal? Why will you not, like Auteurieth, at least momentarily, free yourself from the old system, in order to try once the views of the humoral pathologists, if it were even Sylvius, who considered the body to be a chemical laboratory, and life a chemical process? Try it; tear yourself loose from nosological distinctions, from local phenomena. A decided disease of the fluids needs the eye and the light of chemistry!

She is the sword of the present time, that cuts to pieces the vaccination as vain foolery. As certain as the Atlantic Ocean cannot be swallowed and digested by the river Delaware, as certain can the smallpox poison not be swallowed and digested by the kinpox poison. But you can find their, filthy excrements. Discriminate! As little as the ocean cares for the Delaware, as little does the

smallpox care for vaccination. Does not our time, with its immense number of cases of itch and syphilis, of external and internal pox, whose hero is the cholera, prove the whole doctrine of vaccination to be a falsehood, and the law ordering it, a crime? Does it not show its entire uselessness as a protection manoeuvre?

How the science par excellence wails! Dr. Elsasser already complains some thirty years ago:

"The kinpox have, in the whole, disappointed us in our expectation of their protective value. Vaccination has not been able to remove the tendency to be infected by smallpox. The vaccine is generally overcome and alienated by the real smallpox."

The principal vaccination physician of the kingdom of Wurtemberg, Dr. Seeger, says naively:

"We have indeed, NO criterion to decide, when and in what degree the protecting power of good vaccine is decreased or extinct in an individual. We have NO criterion for the degree of the susceptibility for smallpox of a person. We have NO criterion to determine the period of the duration of the protection. Individuals who have been formerly vaccinated, are, before all others, liable to be attacked by smallpox; (of course, *dignus est operarius mercede sua!*)"

Elsasser says:

"In the course of a general epidemic, a great many of the unvaccinated children get the lightest kind of smallpox. In Baden, where the law requires general vaccination, was the last smallpox epidemic at least as destructive as formerly. Kinpox and smallpox are often found combined, each taking its own course, and both interfering with each other."

And Heim adds:

"The regular smallpox, care not the least for the best flourishing vaccine."

Once more! The disease is yet as malicious as it was at the time of the Arabs, who gave the first description of it, (Rhazes) and cares not a farthing for vaccination! Besides, the vaccine pustule and vaccine mark may stand every kind and variation of smallpox, and other similar matter expulsion possible, at a

time when there exists a smallpox epidemic.

It is certainly a very convenient faith, a sweet sounding syren-song, a very nice practice, that leaves the mind perfectly at ease to think and assume that the vaccination hocus pocus bestows Achillean inviolability; and that the medical holy water purifies perfectly; and that we, therefore, may carelessly violate the temple of Hygiea, the temple of Aesculape, and that we may continue to gluttonize, to carouse, to dissipate without punishment. *Dominus vohiscum! Deus se irrideri non patitur.*

§ 25. "Vaccination is the ONLY reliable means to banish the smallpox with its destructive consequences." We will not even think of its banishment at all, "*ne desinas in piscem;*" it should rather be called their firm settlement in the country, because everybody will, with the great Sarcone, who (1753 to 1755, and 1760 to 1768) saw in Naples the most malignant and fatal epidemics, "easily comprehend, that a body encumbered with the smallpox poison, can only then gain health, when the smallpox come to the surface, or when the impurity, that travels about in the blood and fluids of the body, is ejected through the usual channels."

But if a man has no poison in himself and it is FORCED into him by vaccination and revaccination, the disposition to it must finally show itself. Green wood gets dry, and burns! In the first case, man gets careless against his enemy; in the other, he is thrown treacherously in his arms; and science rests quietly and self-complacently on the easy couch of routine, instead of searching for further and more rational means, because Pythia has clairvoyized of the "only" remedy: "the gold of Ophir."

I have already mentioned above, that the infection spreads after many vaccinations, through this very matter, when it is the least thought of. The smallpox disease could, therefore, never leave us, even if its time had run out. The people hold it closely and firmly in their arms. The plague which devastated (in the 17th century) Europe so frequently, seemed, according to Schnurrer's ingenious view, (Chron. of Epid., 11. 203) in 1666, to dissolve itself for Western Europe, into other milder diseases, f. i. dysentery, purples, scarlet fever, inflammations of the throat, etc. Henssler shows the symptoms of the later syphilis in the symptoms of leprosy; and even this Venus had lost, for some time, the wings of catarrh and exanthem (which she at present seems to reassume) In a great many other contagious and fatal diseases let us recognize the same

process of dissolution in their history of pathological development. How shall and can the same take place with the smallpox, if we assiduously and continually prevent it with all might?

Throw away reason and history! Be it so! The last few years ought to open our eyes mightily; and, where this is not the case, there can't exist eyes at all! With a false passport, under different well known family names of diseases, mostly in the stolen dress of catarrh, sneaks the smallpox poison through the civilized, vaccinated world; it torments the stomach and its fellows; irritates, lames, and softens our nerve marrow; throws the whole economy of our body into misery; veils the soul, and troubles us yet in our dreams. "What is the matter?" exclaims Drugg, "the diseases will not heal properly."

"And I," sighs Lilliput, "am quite out of all precedence; I cure, and nobody gets well! My prescription will not answer the object." The old woman practice is at its wit's end! Have then the stormy times turned the medical science also upside down? The physicians vaccinate furiously on and on; and see, the false and treacherous vaccine goes laughingly to bed with the smallpox poison, and feeds and caresses it! Medicine stands confused before the people! The promised banishment does not really exist; on the contrary, the people complain louder—for like marauders moves the poison, destroying, laming in their interior about, for months and years. High and low immolate, in despair, to superstition, to sympathy, to Spiritualism, in vain!

You, then, benign Nature! Help us; I throw myself on your breast! And see! She sends her fever troops, and throws the enemy, in small skirmishes, or in one pitched battle, partly out of the openings of the body, partly out in blisters and boils. Liberty! Real, sound liberty, of life and happiness, is now felt by the grateful sufferer, but the drug guild and popular infatuation exclaims against it—and vaccinates again and again, instead of forbidding it at once.

The Smallpox Poison exists! It shows itself far more frequently on the internal mucous membrane of the throat, nose, eyes, tongue and mouth, in the intestines, etc., than on the external surface. If it does not make its appearance, we can with mathematical certainty calculate, that it will break out in a wilder form, as decomposing, putrid, contagious disorder and cholera. The government ought, therefore, rather to offer prizes for the wholesome discovery of means, by which the poison could again be brought from the interior of the human body to its surface. But, instead of urging science to learn to act specifically against the

poison itself—instead of forming medical battle lines against the enemy—the old beaten track is followed on and on, a systematic prescription is written, and the people are vaccinated for their own destruction!

Deus sit testis inter me and inter te! Quid vidisti hypocrita? Scientiam profanasti! terram tuam perdidisti! populum tuum occidisti.

§ 26. "According to your lamentations, there ought to be an uncommonly large number of patients and deaths!" Certainly! And I will even acknowledge that there are seasons sometimes remarkably free from fatal diseases. But, we must discern between disease condition, and the breaking out of diseases.

Sickly is the by far greatest number of the people, carrying, as they do, in themselves, the latent poison; but, while some are perfectly conscious of their miserable condition, there are many others too careless of their own self to perceive it.

"I have always had an excellent stomach and perfect digestion: now I have to be extremely careful—a little too much, or not enough, upsets me; the smallest fault in my diet presses and puff a me up, and punishes me with excruciating sufferings!"

The digestion is changeable, slow, difficult and painful; the appetite small, and asks for piquant and cool things, namely: ham, salt fish, salad, fruit, acids. Breakfast is the worst meal, and a sensation of faintness compels them to eat something: for otherwise the condition of the body, without food, would be unbearable. If this weakness is helped by eating, another unpleasantness appears: fullness, distension of the stomach, indolence, and drowsiness. The sufferer feels in an uncomfortable manner, which is often painful in the pit of the stomach, where and how the stomach is situated, and that the digestion is not readily, but lazily, imperfectly, and unwillingly performed.

"My stomach is a perfect vinegar factory, or produces nothing but phlegm: I spit up nothing but salt masses."

Sometimes, there appears some nausea, or some slight vomiting; and a slight diarrhoea relieves much. Things are wrong in the abdomen: it rumbles, pinches and swells; stitches are often felt in the left side; the abdomen hangs down like a drummed and inactive sac; the back complains, knees and feet feel tired; there is less urine than usual; but, what there is, is bad, and somewhat acid; wind and

stool smell carrion-like. The latter contains much slime, and often worms. The emptiness and fullness of the stomach reflect upon the head; the FORMER, as headache, dizziness. "I feel," says my neighbor, "as if I had the very mischief in my stomach."

Another complains: "I have a sensation as if my victuals were in my head."

The LATTER, as merely thick, stupid feeling: the emptiness, at night, as sleepiness, terrible dreams, etc. The fullness, as sorrowful, heavy sleep. The hair of the head decays. The condition of the head indicates clearly the condition of the stomach. This emptiness and fullness of the stomach, is with others reflected in the respiratory sphere. The interior of the throat of some swells up with cherry red color, and grey-white pustules appear; the voice suffers. There is generally something the matter in the throat and back.

With others, again, we find a snaffling, catarrhal irritation of the nose, throat, windpipe, chest, when a dry, hot, sirocco breath is exhaled up from the throat. He longs instinctively for water, swallows greedily quite unusual quantities, and yet excretes comparatively very little by sweat and urine, as if fire was scorching his interior. He now perceives that there is much heat in his body, particularly as he finds that his excrements are also very hot; and yet he feels, on the other side, how little animal heat his body really possesses, how sensitive his external surface is, particularly his spinal column. He does not avoid the burning rays of the sun; he stands before a red hot stove, and presents his back to the heat, and expresses his grateful feelings, by exclamations of "Oh! Ah! O how lovely!"

And other expressions of comfortableness. He then takes, with the greatest exertion, a walk—and sighs, with a quid of tobacco or a cigar in his mouth: "I certainly shall one of these days die from below upwards!" till finally a cup of strong hot coffee, or a glass of hot punch, restores some kind of an equilibrium. At another time is the exterior condition of the temperature quite the opposite. An unpleasant, dry, burning heat, lames and destroys the strength; he hastens to take a bath. He feels best in the open air. As soon as the first digestive labors are over, he enjoys again some comfort, and feels able to exert himself somewhat; he is content, till the debility returns from the stomach. Connected with these symptoms is a tired, melancholic, or an excitable, nervous manner about him, which emaciates one, while another fattens, spongelike.

A third yawns eternally, and sighs without an apparent cause.

A fourth, the most fortunate of all, has on his body always something to scratch, or to plaster.

The fire of the eye, the color, the fullness and the expression of the face expires slowly with the decrease of the elasticity of the muscles and mental activity. Every other weak part of our body begins now to make itself felt. The plethora complains of debility, blood congestion; the blood vessels enlarge; the menses become too copious; the parturition difficult. Old colds, sore throats, worms wake up; rheumatic pains move about like marauders; the piles give unusual trouble; the gout is more irritable and painful; the eruptions and salt rheums get livelier; scrofula appears in all shades as *la maladie du jour* in the foreground; the tuberculous sufferer coughs early and late in crampy attacks; the consumptive goes out like a light, or swells up; dropsy returns; jaundice conceals itself behind a green, yellowish, clay color; history is playing much mischief; syphilis and itch will not heal radically; and a kind of intermittent fever appears readily after a meal.

Thus, with these changes in the digestion, in the feelings of weakness in the muscles, nerves, senses, soul and heart; in the decrease of even body temperature; of sleep, and his usual imbecilities—lives the poor already infected sufferer, without consulting a physician, generally following his inherited superstition, and his perverse instinct in an unsatisfactory condition about himself, whether he be well or sick; he even considers it hardly worth while to molest a physician with his complaints, or to limit his labor.

Although many a father might perceive (if he would only take the trouble to look) that something is wrong about the health of his family; that there passes not a day without complaint; that his wife fades unusually early away; and that his children remain green, and will not bloom; that they very often get fever attacks, and waste away, or eject matter by suppuration from their bodies—although he could see, that everywhere in other families the same sad condition exists: he really sees nothing, thinks nothing, and does nothing. *Time of nullity! Vive le zero!*

This imperfect description of a state, where people do not yet consider themselves sick, indicates the general health condition of our population, undermined as it is by the smallpox and vaccine poison. The people are, in reality, far more diseased than they think themselves. It indicates the dark cloud

that hangs over our life horizon, the seed field of the world contagium, and confirms the old, but highly important position: that in no disease the sympathy with heart, brain and external skin, is so great, as in affections of the mucous membranes; and that they are the deeper and the more tenacious, the less or the more remote from them the pain is.

The legitimate, most radical, and, therefore, most fortunate excretion of this poisonous matter, is, according to experience mediated by the breaking out of the smallpox; a fact that, in later times, has happily often occurred in the most satisfactory manner. Yet people lament about it; and miserable, injurious vaccination is continuously sent in the field against it. What will our experience be, when man himself complains, and the centrifugal power of Nature forms diseases out of those yet quietly resting disease matters; and what is worse yet, when, by and by, the centripetal power of the poison pervades all the various interior provinces of our organization? Then only, when misery and wretchedness grim us with our vaccination marks scoffingly in the face—then only will we hasten to fill the lamp of salvation with the oil of true science. The smallpox matter creeps at present through the inside of the people only, as it were, in great and dark passages. Woe to him who feeds this snake by vaccine!

§ 28. The smallpox matter is a poison produced in our own body, in our stomach, as soon as our vitality, be it in consequence of the condition of our life, or of the years in which we have lived, sinks below the normal standard, and passes over from the vital chemical more into the vial chemical. In the perfect man who is healthily nourished, like a strong tree, all chemistry falls too short; but not in the opposite case. Here is the sickening smallpox matter easily demonstrable. That this matter cannot be Vaccinated out of the body, but only impeded by a radical change in the order of life, and removed by a sensible interference of a natural cure method in its effect and continuous development, is beyond contradiction clear. Our life and medical treatment must be changed: these are the only real protective means against the malicious and destructive enemy of the welfare and increase of the human family. Let us then submit!

Vaccine has changed the civilized world into a deceptive pool of evils, the names of which blind yet the people; it has in reality produced no other benefit, if benefit it be, but a numerically immense increase of physicians. Him, who is ripe for the smallpox, will and can save nothing but the ejection of the matter. To vaccinate him who has got no smallpox matter in him, or who is not yet prepared for their ejection, and then congratulate him as being safe from the disease, is a

PERNICIOUS SIMPLICITY, but not a SANTA SIMPLICITAS; it is SUBLIMELY RIDICULOUS. Whoever is unable or unwilling to free himself at once and entirely from this sweet Baal's faith, may have the pleasure to look at the children whom my intervening protest has already saved from vaccination.

The difference between vaccinated and unvaccinated children is striking, and so palpable, that words are unnecessary. In families, those that are vaccinated, always give me the most trouble. If you wish to be better satisfied yet, raise beside a vaccinated child, an unvaccinated one! Cease to play frivolously with the life happiness of your child! Let us by all means restore the beneficial love relation with good old mother Nature, by the well regulated use of her natural gifts, and by the purer application of her pure remedies; and let us drive the poisoning imp, the good-for-nothing vaccine, out of the country.

Let us accuse none! Government and physicians have acted in good faith. Although we must stand confused and overwhelmed in painful silence before the past follies, let us learn from it for the future! *Pudore victi in nos ipsos descendamus, resipiscamus. Hominis errare, insipientis vero in errore perseverare!*

We decidedly require this:

1. That every regulation imposing vaccination, be at once abolished.
2. That every physician and government warn the people against vaccination.
3. That every physician who ventures to vaccinate, be made responsible for the injury done by his act.
4. That the legislative bodies will enact laws for the prohibition of vaccination, for the reason that the operator exposes himself to the danger of injuring, or even killing an innocent human being.
5. That the government make it an object of particular care, to try to retrieve the immense injury done already by vaccination, by establishing bathing establishments, etc.

§ 29. How much more prosperous would this so eminently blessed country be, if vaccination had never been introduced, or would have been forbidden as a

sanitary measure! And how much happier would the people be in soul and body, and general welfare, had they never been vaccinated!

The latter question has, as far as the body is concerned, been already answered; the former is a matter for the consideration of the government. The continued encroachment of poison in the physical state body, is clearly an important external event—an historical "fait accompli," the cause of which can change in the same manner as it has shown itself injurious in the single organism, the metamorphosis of the organization of the state, and, if persisted in, may impede and destroy society in its free development and progress. The political life of a nation is mostly the expression of their physical condition. Not the spirit nourishes the body, as Virgil says, but the body the spirit.

When organizations that are not poisoned, but harmoniously conditioned, live socially together, we can comprehend how easily a unite-tie of order, morality, and welfare may embrace them. Let us further examine, with Foster, their connection with regard to the sound stomach. The quality, quantity, the combination of food have the greatest influence, not alone on the momentary impressions which our soul receives, but also on its social disposition or humor. A man is, no matter how sober he may be before a meal, not what he is after it. A glass of liquor, a cup of coffee, give different degrees of vivacity, of activity, of irritability, despondency, or hilarity. One kind of food, because it lies heavily in the stomach, makes us morose and fretful; another, because it is easily digested, disposes us to amiability and kindness.

The use of vegetables alone makes, because they are not nutritious enough, the body weak, and predisposes us to quiet, laziness, and mildness; the use of nutritious meats and fluids, which stimulate the nerves, produces restlessness, excitement, and courage. In these habits of nutrition, originate habits in the bodily constitution and organs, out of which the various temperaments form themselves. Long experiences had taught the ancients, that the knowledge of Dietetics form an important part of moral philosophy. The ancient Persians and Greeks acted in the areopagus upon important matters only before meals. Those people, who in the heat of meals, or under the vapor of digestion, consult about important affairs, show, in their assemblages, violence and stormy excitement; and their resolutions are often unreasonable and rebellious. If this is the case with the healthy stomach, what shall we expect of one that is poisoned?

Many a disorder and row would not take place, if the smallpox poison did not

irritate, torture, and often paralyze the digestive apparatus; and it would not be difficult to derive many a disorderly tumult of our eminent men, and their unbecoming violence in the legislative chambers of our governments, from that same source. More yet! The vaccine and smallpox poison penetrates into the very mass of fluids of the people; the whole life disposition, therefore, that is, the whole revelation of their mind and heart, gets disturbed; their intelligence, their conviction, their principles, their religion, their ideas of freedom, right and duty, their character and fate, become injuriously affected and changed. The disharmony of the organs must necessarily drag the mind into the bodily quarrel, and the intellectual and physical development of the individual cross each other most disturbingly. The body and the soul of man can never be thought as separated in this life. Such serious physical changes, as a many years continued poisoning, must of necessity have the most decisive influence upon the political horizon of the country. A. von Humboldt says:

"The influence is eternal, which the physical nature exercises over the moral disposition of man."

And Schnurrer adds:

"Physical events have really, in every period of history, if not incited, at least laid hold of the fates and epochs of the human family."

CONCLUSION

THE FALL OF MAN

Now the country wench was more subtle, than all persons else, and she said unto Science: "Should God have said, ye shall not eat of every thing of the cow?"

And Science said unto the wench: "We may eat of the cow whatever is wholesome—the flesh and the milk. But we must not eat the flesh of a diseased cow, or drink the milk of a sick udder; least of all must we take into ourselves the diseased eruption of the kinpox. Most painfully do I recall the years of murrain, when God said: 'Ye shall not eat of the cow, nor shall ye even touch it, lest ye die!' "

And the wench said unto Science: "Ye shall surely not die; for God knoweth that,

in the day ye vaccinate with the kinepox—ye need not swallow it—ye will wrest yourself from fate and necessity, into freedom, be exempt from smallpox, handsomer, stronger and more spiritual than ever!"

And when Science saw that such easy work was more pleasant than racking the brain, she summoned her man, the physician, to visit the cow in the stable; and he, too, comprehended that this practice would be more comfortable. And the eyes of both "were opened," and they knew that the Lord had dissolved the murrain and the smallpox, though Jenner had not, and covered their nakedness with vaccine reports and optimist reasonings.

And they heard again, in our day, the voice of the Lord walking in the garden of the peoples, with influenza, smallpox, typhus, cholera, yellow fever; with many other malignant and putrid evils. And the physician "hid' himself" behind the medical college and government from this clear truth.

And the Lord called from among the complaining peoples, saying: "Physician, where art thou?"

And the physician answered: "I heard the wail of the peoples, and I was afraid; for I know not how to heal the wounds I have inflicted, and therefore I hid myself."

And the Lord said: "Who told thee that thou hadst acted without sense and reason? Hast thou not—in mockery of all sound sense, and merely following the tattle of a country wench—thoroughly poisoned my peoples?"

And the physician replied: "The college where I studied, and all my medical brethren advised me to vaccinate, and so I vaccinated!"

And the Lord said unto Science:

"What is this that thou hast done?"

And Science answered:

"A country wench asserted, that she would not get the smallpox, because she had had the kinepox."

And the Lord said unto the girl: "Because thou hast done this, thou shalt suffer most from vaccination; thy youth shall not bloom as the flower of the field; thy spine shall curve under the inner poison; thy sick body shall hinder thy development, and thou shalt eat steel and earth. There shall be enmity between thee and medicine. If thou seekest help from the cow, milk and whey shall harm thee; and there shall be little joy for thee in the drug shop, or on the orthopaedic bed, or in the tendon cut, piercing thy heel. And when thou becomest a wife, thou shalt look greenish-yellow, and have many sorrows, when thou art blessed; thou shalt bring forth thy children in pain and anguish, with the help of a physician; and the poison shall be divided between thee and thy child."

And unto the man the Lord said:

"Because thou hast hearkened to the prattling voice of a foolish country girl, and permitted thy house to be filled with poisonous matter, which divine Nature found to be unfit even for a beast, and therefore ejected it, thy wife and thy children, instead of being the happiness of thy existence, shall cause thee much trouble, and anxiety and expense; thy marriage shall bring forth for thee thorns and thistles, instead of joy and blessedness."

But the Lord drove the physician out of Paradise, and placed before the garden of families and people, the flaming cherub:

"of a severe Law, which is the result of rational research, and which will lead humanity to a more prosperous future by a return to Nature."

The judgment of the New Testament is:

"If any man shall defile the temple of God, him shall God destroy; for the temple of God is holy, which temple ye are."—1 Cor. iii. 17.

THE END
